Βυζαντιον, said to have been named after Biçaç (Βυζαντ-), its reputed founder*]. 1. *a.* Pertaining to Byzantium, or Constantinople, an ancient city of Thrace, situated on the Bosphorus, which became the capital of the Byzantine or Eastern empire, or to the empire itself. Byzantium was founded by a Greek colony in the seventh century B. C., but was of no great importance until A. D. 330, when the emperor Constantine the Great made it his capital, and changed its name to Constantinople, after himself.—**Byzantine architecture**, a style of architecture developed from the classical under the Byzantine empire during the fourth and fifth centuries A. D., and, under various modifications, used till the final conquest of

that empire by the Turks in A. D. 1453. It spread so widely that its influence even in Italy did not wholly decline before the fifteenth century, and it may be considered as surviving still in Russian architecture, and in a less marked degree in other eastern lands. An almost universal feature of the style, in buildings of any pretension, is the incrustation of brick or rough stonework with more precious materials; large spaces are left void of bold architectural features, to be rendered interesting merely by surface ornament of polished marbles presenting natural beauty of hue, or of sculpture in very low relief, and confined in the main to vegetable or geometrical designs of clearly cut outline. The style depends much on color for its effect, and mosaics wrought on grounds of gold or of positive color are profusely introduced. The leading forms which characterize the Byzantine style are the round arch, the circle, the cross, and the dome supported upon pendentives. The capitals of the pillars are of endless variety, and full of invention. While some are plainly founded on the Greek Corinthian, many resemble those of early round-arched western architecture; and so varied is their decoration that frequently no two sides of the same capital are alike. The ancient basilica of St. Sophia, in Constantinople, and the church of St. Mark, in Venice, are classical examples of Byzantine architecture.—**Byzantine historians**, a series of historians and chroniclers of the affairs of the Byzantine empire, scattered through the whole period of its existence. They are our only source of knowledge of Byzantine history. Their works have been several times printed complete in the original Greek, the latest edition being by Niebuhr and others, in 48 volumes.

1. The third letter and second consonant in the English, as in general in the other alphabets derived from the Phœnician. The value of the sign, however, in Phœnician as in Greek, was that of a hard *g* (in *go, give*); and so also originally in Latin, beside the sign *k*, which had the proper *k*-sound. But the Latins gave up for a time the written distinction of the *k*-sound from the *g*-sound, writing both with the same character, *C*; and when later they readopted the distinction, instead of reducing *C* to its original value, and restoring *k*, they retained the *k*-value for the *c*, and added a tag to the same character for the *g*-sound, thus turning *C* into *G*. The comparative table of forms, like that given for the other letters (compare *A* and *B*), is as follows:

Egyptian Hieroglyphic. Hieratic.	Phœnician.	Greek.	Early Latin.

Great as is the apparent difference between Greek *T* and our *C*, it is due only to a shifting of the position of the angle made by the two component lines, and the rounding of this angle. The hard or *k*-sound which belonged to this character in early Latin belonged to it also in Anglo-Saxon (which, like Latin, made little or no use of *k*). But this *k*-sound, as being a guttural or back-palatal mute, is particularly likely to be shifted forward along the tongue and to be changed into front-palatal and sibilant sounds, especially before vowels like *e, i, y*, which favor the front-palatal position. Hence it comes that *c*, still so written, is pronounced as *s* in English before *e, i, y*, and elsewhere as *k*. But this "soft" or sibilant *c*, *y*, and the French part of our language; the Anglo-Saxon *c*, when softened, gets the sound usually represented in English by *ch*, and is so written: for example, in *chicken, cheese, church, birch, teach*. (See *ch*, and *assimilation*.) No word containing *c* pronounced *s* is of Anglo-Saxon origin, except a few misspelled, as *cinder* for *sinder*, and *once, twice, etc., pence, mice, etc.*, having *-ce* for original *-es, -s*. (See *-cel*.) For the sounds of *ch*, see *ch*.

2. As a numeral, in the Roman system, *C* stands for 100, and is repeated up to CCCC, 400 (followed by *D*, 500). This symbol, originally that is, the Greek theta (θ), was afterward reduced to *C* and understood to stand for *centum*, a hundred.

3. As a symbol: (a) In music: (1) Used in English and German to designate the key-note of the natural scale. See *natural* and *scale*. (2) When placed on the staff immediately after the clef, a sign of common time, each measure containing 4 quarter notes or their equivalent. When a vertical line is drawn through it, it indicates *alla breve* time, each measure containing 2 or 4 half notes, played more quickly than in common time. (3) On the keyboard of the organ or pianoforte, the white key or digital next to the left of each group of two black keys. The middle *C* of the keyboard is a usual starting-point in the reckoning of both keys, tones, and notes; it is also known as *alto C*, or *c*; the next *C* below is called *tenor C*, or *c*; the second *C* below, *bass c*, or *C*; and the next *C* above, *treble C*, or *c*, etc. The present pitch of middle *C* is from 250 to 265 vibrations per second; it is often theoretically fixed in Germany at 264, in England at 256, and in France at 251. About 1700 it was actually about 240, and in recent times as high as 275. The major scale of *C*, because it comprises all the white keys and none of the black ones, is taken as the normal or standard scale of the keyboard. (b) In the mnemonic names of moods of syllogism, the symbol of reduction *per impossibile*. (c) In *math.*, *C* is used to denote a constant of integration. See also *A*, 2 (*c*), (*d*), (*e*). (d) In *chem.*, the symbol for carbon.

4. As an abbreviation, *c.* or *C.* stands, in dental formulas of zoölogy (*c.*), for *canine tooth*; in United States money (*c.*), for *cent*; in thermometer-readings (*C.*), for *centigrade*; in French money (*c.*), for *centime*; in references (*c.*), to *chapter* (or Latin *capitulum*); in dates, before the number (*c.*), for Latin *circa*, about; in meteorology (*c.*), for *cirrus*; in a ship's log-book (*c.*), for *cloudy*; and in measures of volume (*c.*), for *cubic*.—Middle *C*, in music, the note on the first ledger-line above the bass or below the treble staff. (See above.)

It especially resorts to the shores of the Orkney, Shetland, and Farøe islands, Iceland, etc., appearing in herds of from 100 to 1,000 individuals. The new vehicles were hooded chaises, drawn by one horse, and carrying only one passenger besides the driver, who sat in the cabriolet (or, as more commonly called for brevity, the cab) with his fare. . . . It was equal to 2.021 liters, or $\frac{4}{5}$ United States pints. Other statements appear to be due to confusion of different measures by Greek metrologists; but a great *cab*, of $\frac{2}{3}$ the ordinary size, is mentioned in the Talmud.

They besieged it [Samaria] until an ass's head was sold for fourscore pieces of silver, and the fourth part of a cab of dove's dung for five pieces of silver. 2 Ki. vi. 25.

4. A number of persons united in some close design, usually to promote their private views in church or state by intrigue; a *junto*. The name of "the *Cabal*" was given to an unpopular ministry of Charles II., consisting of Clifford, Ashley, Buckingham, Arlington, and Lauderdale, the initials of whose names happened to compose the word.

These ministers were therefore emphatically called the *Cabal*; and . . . it has never since their time been used except as a term of reproach. *Macaulay*, *Hist. Eng.*, II.

=Syn. 4. *Combination, Party, Faction, Cabal, Camarilla, Junto*. *Combination* is the most general of these words, but it expresses least of permanence in organization; it often denotes the union for special ends of individuals or parties otherwise antagonistic: as, the Democrats and Greenbackers entered into a *combination* to secure the election. A *party* is strictly a more close and permanent union of individuals, organized to promote certain principles or common interests which they consider of fundamental importance: as, the Low Church *party*, the Republican *party*; but the term is more loosely used where organization is wanting: as, the Free-trade *party*. *Combination* and *party* may express that which is entirely reputable; the other words are chiefly unfavorable in their signification. A *faction* is commonly a section of a party; it is generally a comparatively small number of individuals, whose principles and objects are often of a capitious, frivolous, or selfish nature, but advocated so persistently as to be annoying, and with so little regard to the general interest as sometimes to be dangerous. *Cabal* and *junto* express a union less comprehensive than *party* or even *faction*; the intrigues of a *cabal* or *junto* are usually conducted mainly for the personal aggrandizement of its members. *Junto* has almost entirely given place to *cabal* in modern use. A *camarilla* is a more or less united body of secret counselors of a ruler, acting generally in opposition to his official advisers, and constituting a "power behind the throne."

After numerous abortive attempts and unsuccessful combinations in which Newcastle bore the chief part, it became evident . . . that the union . . . of Newcastle . . . and Pitt was absolutely necessary.

Lecky, *Eng. in 18th Cent.*, viii.

If I could not go to heaven but with a *party*, I would not go there at all. Therefore I protest to you I am not of the *party* of federalists.

Jefferson, *Correspondence*, II. 439.

By a *faction*, I understand a number of citizens, whether amounting to a majority or minority of the whole, who are united and actuated by some common impulse of passion, or of interest, adverse to the rights of other citizens, or to the permanent and aggregate interests of the community.

Madison, *Federalist*, No. 10.

In a simple monarchy, the ministers of state can never know their friends from their enemies; secret cabals undermine their influence and blast their reputation.

cabala, kabala (kab'á-lá), *n.* [ML. *cabbala* (It. Pg. *cabala* = Sp. *cabala* = F. *cabale* = G. Dan. Sw. *kabbala*), a transcription of Heb. *qabbālāh*, reception, the cabala or mysterious doctrine received traditionally, < *qābal*, receive, take, in the Piel conjugation *qibbēl*, receive (a doctrine). Hence *cabal*¹.] 1. The theosophy or mystic philosophy of the Hebrew religion, which grew up mainly after the beginning of the tenth century, and flourished for many generations. The cabala employed itself first in a mystic explanation of Deity and cosmogony, and in the creation of hidden meanings for the sacred Hebrew writings, thus drawing into its province all the Hebrew law and philosophy. Later cabalists pretended to find wonderful meanings even in the

letters and forms of the sacred texts, and made for themselves elaborate rules of interpretation.

The cardinal doctrines of the cabalists embrace the nature of the Supreme Being, the Divine emanations or Sephiroth, the cosmogony, the creation of man, psychology, the destiny of man and the universe, and the import of the revealed law. The cabalists seem to have endeavored to identify all such sciences as demonology, astrology, chiromancy, sympathetic medicine, etc., with their theosophic mysticism, weaving the whole into a secret universal wisdom or esoteric philosophy of the universe. They sympathized with many points of Christianity, so that in the fifteenth and sixteenth centuries the cabala was by many thought highly important as a proof of Christianity and as a means of converting the Jews.

The Cabalists had a notion, that whoever found out the mystic word for anything attained to absolute mastery over that thing. Lowell, Among my Books, 1st ser., p. 158.

In Great Britain, though the executive government is vested nominally in the crown, it is practically in a committee of ministers called the *cabinet*, which is of comparatively modern development. Every cabinet includes the First Lord of the Treasury, who is generally chief of the ministry, or prime minister, the Lord High Chancellor, the Lord President of the Council, the Chancellor of the Exchequer, the First Lord of the Admiralty, and the five Secretaries of State, with two or more other members, at the prime minister's discretion. of State, the Treasury, War, the Navy, the Interior, Commerce and Labor, and Agriculture, the Postmaster-General, and the Attorney-General. They are appointed by the President, and with the advice and consent of the Senate, and are removable at the President's pleasure. They have as a body no legal functions, but by custom meet the President at stated times for consultation. The term *cabinet* is also sometimes applied to the executive council of a governor or of a mayor.

The insulating layers are generally separated from the outer wires by a padding of jute or hemp saturated with tar or other protective substance. called *nef* [*F. nef*, a ship, a nave: see *nave*]); those of the Renaissance are generally oblong cases, divided into compartments. The cadenas was placed on the table, beside the person who was to use it.

See phrases below. (b) The concluding part of a melody or harmony, or the concluding part of a metrical line or verse: as, the plaintive *cadence* of a song. Also called a *fall*. (c) Especially, in France, a trill or other embellishment used as part of an ending, or as a means of return to a principal theme. Compare *cadenza*.—5. of the tonic. These two forms of the perfect cadence were in ancient church modes called *authentic*, in distinction from the *plagal* cadence. An example of each form in C major is here given. The end of a piece should properly be a complete cadence, incomplete and interrupted cadences being suitable only as temporary endings for phrases or periods in the midst of a piece.—**Imperfect cadence**, the chord of the tonic followed by that of the dominant; it rarely occurs as a final close.—**Interrupted or deceptive cadence**, a cadence formed by a chord foreign to that which was expected, thus evading the close and deceiving expectation. Thus, in the example, the second chord has A in the bass instead of C, which is naturally expected. Also called *suspended cadence*.—**Medial cadence**, a cadence in ancient church music in which the mediant was the most important note.—**Mixed cadence**, a cadence in which a subdominant is followed by a dominant, and this by a tonic chord: so called from its being a combination of the authentic and plagal cadences of ancient church music.—**Plagal cadence**, a cadence which con-

sists of the chord of the subdominant followed by that of the tonic: frequently used at the close of chants or hymn-tunes with the word "amen," and sometimes popularly called the *amen cadence*.—**Suspended cadence**, an interrupted cadence.

cadence (kād'ens), *v. t.*; pret. and pp. *cadenced*, ppr. *cadencing*. [*ME. cadence*, *n.*] To regulate by musical measure: as, well-cadenced music.

These parting numbers *cadenc'd* by my grief.

cadency (kād'en-si), *n.* [*Extended form of cadence*: see *-ency*.] 1. Regularity of movement; rhythmical accord.

But there is also the quick and poignant brevity of it [repartee] to mingle with it; and this, joined with the *cadency* and sweetness of the rhyme, leaves nothing in the soul of the hearer to desire.

Dryden, *Essay on Dram. Poesy*.

2. In *her.*, the relative status of younger sons.

Also *brisure*.—**Marks of cadency**, in *her.*, bearings used to distinguish the shields of the second son, the third son, etc. This is sometimes effected by a bearing differing only in details on the shields of the different sons, as a label having three, four, or more points, to mark their respective order. It is also effected by means of a totally different bearing. Thus, in modern times it has been ordained that the eldest son should wear a label during the lifetime of his father, or until he inherits the paternal shield, without marks of cadency; the second son a crescent, the third a mullet, the fourth a martlet, the fifth an annulet, the sixth a fleur-de-lys, the seventh a rose, the eighth a cross moline, the ninth a double quatrefoil. The mark of cadency may become a permanent part of the shield if the younger son acquires estates of his own and builds up a family of consequence; thus the *bordure*, which is originally a mark of cadency, has often become a permanent bearing, and the shield which contains it bears new marks of cadency when borne by the sons of its possessor.

cadene (ka-dēn'), *n.* [*F. cadène*, < *Pr. cadena*, a chain, = *Sp. cadena*, a chain, the warp in weaving, < *L. catena*, a chain: see *catena* and *chain*.] A common kind of carpet imported from the Levant. *E. H. Knight*.

Hence, from *L. cadere*, ult. *E. cadence, chance, case*¹, *casual, cadaver, accident, incident, occident, etc., decay, decadence, etc.*] 1. Falling; sinking. [Rare.]

2. In *astrol.*, falling from an angle: applied to the third, sixth, ninth, and twelfth houses, which follow the meridian and the horizon.—3. Specifically applied to the tenth of Professor H. D. Rogers's fifteen divisions of the Paleozoic strata of Pennsylvania, which suggest metaphorically the different natural periods of the day. It corresponds to the Hamilton group of the New York survey.

cadenza (ka-den'zä), *n.* [*It. : see cadence.*] In music, a more or less elaborate flourish or showy passage introduced, often extemporaneously, just before the end of an extended aria or concerto, or as a connective between an intermediate and a final division. It is always intended to display the technical proficiency of the performer, and to arouse wonder and applause, and hence, except in the hands of a master, is often deficient in intellectual or expressive character, as well as incongruous with the remainder of the piece. Modern composers, therefore, usually write out cadenzas in full, instead of trusting, as was customary in the seventeenth and eighteenth centuries, to the taste and readiness of singers and players. Also called *cadence*.

cade-oil (kād'oil), *n.* [After *F. huile de cade* (*ML. oleum de cada*, oil of juniper; *G. kaddig-öl*): *huile*, oil (see *oil*); *de* (< *L. de*), of; *cade* (= *Pr. cade* = *Sp. cada* = *ML. cada*), juniper, prob., like *G. kaddig, kaddik*, < *Bohem. kadik, juniper*.] An oil strong with empyreumatic principles, extracted from juniper-wood by distillation, and used in France and Germany, in veterinary practice and in human therapeutics, for eczema and other skin-affections. cadet¹ (ka-det'), *n.* [In 17th century *cadet*, later *Sc. cadet*, a younger son (and in extended sense *cadie, caddie*, etc.: see *caddie* and *cad*), < *F. cadet*, a younger son, < *OF. dial. capdet*, < *ML. capitellum*, a little head, dim. of *L. caput* (*capit-*), head. The cadet was the 'little head' of his own branch of the family, in distinction from the eldest son, the 'head' of the whole family. The former practice of providing for the younger sons of the French nobility by making them officers of the army gave rise to the military use of the word.] 1. The younger or youngest son.

He [the abbate] was the cadet of a patrician family, . . . with a polite taste for idleness and intrigue, and for whom no secular sinecure could be found in the State.

Houelle, Venetian Life, xxi.

Hence—2. One of the younger members, or the youngest member, of any organized association or institution.—3. One who carried arms in a regiment as a private, but solely with a view to acquiring military skill preparatory to a commission. His service was voluntary, but he received pay, and was thus distinguished from a volunteer.—4. A young man in training for the rank of an officer in the army or navy, or in a military school. Specifically—(a) One who is under training for a commission in the army or navy by a course of instruction and military discipline in the United States Military Academy at West Point, or the United States Naval Academy at Annapolis. Cadets are nominated for admission, after examination, by the President, a United States senator, or a member of Congress. By an act of Congress, approved July 1, 1902, the title 'naval cadet,' was changed to 'midshipman.' (b) One who is undergoing a similar course of instruction and discipline in the Royal Military Academy at Woolwich or the Royal Military College at Sandhurst in England or in one of the numerous cadet-schools of Germany, etc.

cadmium (kad'mi-um), *n.* [*NL.*, < *L. cadmia*: see *cadmia*.] Atomic weight, 112.3; chemical symbol, Cd. A metal discovered by Stromeyer in 1817, resembling tin in color and general appearance, and, like that metal, having a "cry" when bent. The specific gravity of the cast metal is 8.62; of the rolled, 8.69. Its hardness is between that of gold and tin, and it is easily rolled to sheets or even to very thin foil. It fuses at about the same temperature as tin, 467° F., and communicates to various alloys the property of fusing at very low temperatures. (See *Wood's metal*, under *metal*.) If 8 to 10 per cent. of cadmium be added to Rose's metal, its fusing-point is lowered to 167°. Cadmium is a common accompaniment of zinc ores, both blende and calamin, and it is in the smelting of these

that the commercial metal is obtained, which is done almost exclusively in Silesia and Belgium. Some kinds of blende contain as much as 3 or 4 per cent. of sulphid of cadmium. This metal also occurs by itself naturally in combination with sulphur, forming the rare mineral called greenockite (which see). The manufactured sulphuret is of importance as furnishing a brilliant and permanent yellow color called cadmium-yellow (see below). This is used by artists, also in coloring soap, and to some extent in calico-printing; it is also used for giving a yellow luster to the surface of porcelain. The total produce of cadmium is supposed to be about two tons a year.—**Cadmium blende**, the mineral greenockite.

cadmium-yellow (kad'mi-um-yel'ō), *n.* A pigment prepared by precipitating a solution of sulphate of cadmium with sulphureted hydrogen, forming sulphid of cadmium. It varies in shade from a light yellow to a deep orange, and all its tones are very clear and bright. It possesses good body and is permanent to light and air.

To fill the cadres of the army a well-trained and organized militia stands always ready.

It was originally merely the Greek herald's staff, a plain rod entwined with fillets of wool. Later the fillets were changed to serpents; and in the conventional representations familiar at the present day the caduceus is often winged. The caduceus is a symbol of peace and prosperity, and in modern times figures as a symbol of commerce, Mercury being the god of commerce. The rod represents power; the serpents represent wisdom; and the two wings, diligence and activity. In heraldry it is blazoned as a staff having two serpents annulated about it, mutually respectful, and joined at the tails; it is a rare bearing.

The family alone constitutes an order variously named *Ophiomorpha*, *Gymnophiona*, *Pseudophidia*, *Apoda*, etc. It contains 14 genera. *Cæcilia* is the principal one, occurring in South America; 5 others are South American, 3 Asiatic, and 5 African. More than 30 species are known. Some of the *Cæciliidæ* attain a length of several feet; they burrow in the ground, and sometimes take to the water. According to some, they live on vegetable matter; according to others, upon worms and insect-larvæ. Often, but erroneously, spelled *Cæciliidæ*; also *Cæciliadæ*, *Cæciliidæ*.

2. In *zool.*, any cæcal diverticulum or intestinal appendage ending in a cul-de-sac. See *cuts under Asteroidea and Ink-bag*. In mammals there is but one cæcum, sometimes of enormous extent, as in the ruminants and herbivorous species generally. It is given off from the colon at the point where the small intestine enters it. In birds there are usually two cæca; sometimes one cæcum, attaining great size in some cases, as of the herbivorous geese; sometimes none. There being no obvious distinction between the ileum and the colon in birds, the site of the cæca or cæcum is taken as the beginning of the colon. In fishes cæca are often numerous and large. A cardiac cæcum forms a prolongation of the cardiac end of the stomach in the blood-sucking bats of the genus *Desmodus*.

Alliterative Poems (ed. Morris), li. 1478.

Ça ira (sâ ē-râ'), [F., 'it [the Revolution] will go on': çà, contr. of *cela*, that (< *ce*, this, + *là*, there); *ira*, 3d pers. sing. fut. (associated with *aller*, go: see *alley*), < L. *ire*, go.] The earliest of the popular songs of the French Revolution of 1789. Its refrain (whence the name), "Ah! çà ira, çà ira, çà ira," is said to have been suggested by the frequent use of this phrase by Franklin in Paris with reference to the American Revolution. The original words (afterward much changed) were by Ladré, a street-singer; and the music was a popular dance-tune of the time composed by Bécourt, a drummer of the Grand Opera.

cially, one of a class of large heaps of stones common in Great Britain, particularly in Scotland and Wales, and generally of a conical form. They are of various sizes. Some are evidently sepulchral, containing urns, stone chests, bones, etc. Some were erected to commemorate a great event, others appear to have had a religious significance, while the modern cairn is generally set up as a landmark, or to arrest the attention, as in surveying, or in leaving a record of an exploring party or the like. See *barrow*.

See *cut under coffer*.—3. In *civil engin.*: (a) A vessel in the form of a boat, used as a float-gate in docks. (b) An apparatus on which vessels may be raised and floated; especially, a kind of floating dock, which may be sunk and floated under a vessel's keel, used for docking vessels at their moorings, without removing stores or masts. (See *floating dock*, under *dock*.) (c) A water-tight box or casing used in founding and building structures in water too deep for a coffer-dam, such as piers of bridges, quays, etc. The caisson is built upon land, and then chained and anchored directly over the bed, which has been leveled or piled to receive it. The masonry is built upon the bottom of the caisson, which is of heavy timber. As the caisson sinks with the weight, its sides are built up, so that the upper edge is always above water. In some cases the masonry is at first built hollow, and is not filled in until after it has reached its bed, and its sides have been carried higher than the surface of the water. Sometimes the sides of the masonry itself form the sides of the caisson. In another form the caisson, made of heavy timbers, is shaped like an inverted shallow box, having sharp, iron-bound edges. The weight of the masonry forces the caisson into the sand and mud on the bottom. Air under pressure is then forced into the caisson,

driving out the water and permitting the workmen to enter through suitable air-locks. A sealed well or a pipe and sand-pump are provided, through which the material excavated under the caisson may be removed. The latter gradually sinks under the weight of the superstructure and the removal of the loose soil below, until a firm foundation is reached, when the whole interior of it is filled with concrete. The caissons beneath the towers of the East River suspension-bridge, connecting New York and Brooklyn, are of this description. The *pneumatic caisson* is an inverted air-tight box, into which air is forced under a pressure sufficient to expel the water, thus leaving a space in which men can work to loosen the soil as the caisson descends. The principle of the pneumatic caisson is applied to the sinking of large iron cylinders to serve as piers or land-shafts. Sometimes written *caisson*.

Whether *Calamites* should be considered as being a peculiar form of *Equisetaceae*, or as constituting a distinct but allied order, has not yet been fully established. The *calamites* are considered to have been cryptogamic plants, but their relations to living cryptogams are peculiar, and especially exceptional in their complex structure and the exogenous growth of the woody cylinder. The foliage of the *calamites* was verticillate; and it is thought by some that *Asterophyllites*, *Annularia*, and even *Sphenophyllum*, with their whorled leaves, represent the leaf-bearing branches of *calamites*, although this has not been actually proved by discovery of the leaves attached to the stems. The *calamites* are among the commonest and most characteristic fossil plants of the coal-measures.

3. [*cap.*] A very large genus of slender, leafy, climbing palms, natives chiefly of eastern Asia and the adjacent islands. Their leaves are armed with strong reversed thorns, by means of which they often climb the loftiest trees. The sheathing leaves cover the entire stem, and when removed leave a slender-jointed polished cane, in some species reaching 200 feet in length. These are extensively used in bridge-making, for the ropes and cables of vessels, and, when split, for a great variety of purposes. They form the ratan-canes of commerce, used in large quantities for the caning of chairs, etc. One of the larger species, *C. Scipionum*, furnishes the Malacca canes used for walking-sticks. The fruits of *C. Draco* yield the red resin known in commerce as dragon's-blood.

4. A tube, usually of gold or silver, through which it was customary in the ancient church to receive the wine in communicating. The adoption of the calamus doubtless arose from caution, lest any drop from the chalice should be spilled, or any other irreverence occur. It has fallen into disuse, except that it is still retained in the Roman Catholic Church in solemn papal celebrations, for the communion of the Pope. It is also known by the names *canna*, *pugillaris*, and *fistula*.

There is sometimes a pair of spurs, one above the other, on each shank, as in the genus *Polyplectron*. (See cut under *calcarate*.) Spurs are commonly developed only in the male sex, not passing a rudimentary condition, if found at all, in the female. (See cut under *tarsometatarsus*.) It oxidizes readily in moist air, and at a red heat burns vividly, forming calcium oxide, CaO, or quicklime, one of the alkaline earths. On adding water this forms calcium hydrate, Ca(OH)₂, or slaked lime. Calcium is not found native in the metallic state, but it unites with most of the non-metallic elements in compounds which are widely distributed in nature and extensively used. The mineral calcite, all limestone or marble, and the chalk deposits are calcium carbonate; gypsum is calcium sulphate; and calcium also enters into the composition of nearly all the native silicates.

a very intense white light produced by turning two streams of gas, one of oxygen and the other of hydrogen, in a state of ignition, upon a ball of lime. Captain Drummond, the inventor, proposed the use of this light in lighthouses. Another light, previously invented by him (1825), was employed in geodetical surveys when it was required to observe the angles subtended between distant stations at night. The light was produced by placing a ball or dish of lime in the focus of a parabolic mirror at the station to be rendered visible, and directing upon it, through a flame arising from alcohol, a stream of oxygen gas. Also called *Drummond light*, *oxycalcium light*, *limeball-light*, and *lime-light*.

The figurative uses of these words are not suggested by any comparison of their literal meanings; in them all some mental estimate may be supposed to be made, akin to an arithmetical process. "I *reckon* that the sufferings of this present time are not worthy to be compared with the glory which shall be revealed in us." Rom. viii. 18. The use of *calculate* for *reckon* in such a case as this is an Americanism. "I *count* not myself to have apprehended." Phil. iii. 13. *Reckon* may be used in such a connection, but not the other two words.

When they come to model heaven

And *calculate* the stars. *Milton, P. L., viii. 80.*

After its own law and not by arithmetic is the rate of its [the soul's] progress to be *computed*.

Emerson, Essays, 1st ser., p. 249.

He presently confided to me, . . . that, judging from my personal appearance, he should not have thought me the writer that he in his generosity *reckoned* me to be.

O. W. Holmes, Old Vol. of Life, p. 65.

Honour and pleasure both are in thy mind,

And all that in the world is *counted* good.

Sir J. Davies, Immortal. of Soul, xxiv.

II. intrans. 1. To make a computation; arrive at a conclusion after weighing all the circumstances; form an estimate; reckon: as, we *calculate* better for ourselves than for others; to *calculate* on (that is, with expectation of) fine weather.

2. To speculate about future events; predict.

Old men, fools, and children *calculate*. *Shak., J. C., i. 3.*

3. To suppose or believe, after deliberation; think; 'guess'; 'reckon': as, you are wrong there, I *calculate*. [Colloq., New Eng.]

Godwin, St. Leon.

calculating-machine (kal'kü-lä-ting-mä-shôn'), *n.* Any machine which performs numerical calculations. The principal kinds are: (a) Multiplying and dividing machines. (b) Difference-engines, which calculate and print tables from the initial values of the tabular number and its first, second, etc., differences. The first of these was that of Babbage, of which the Scheutz machine, now at the Albany observatory, is a modification. (c) The analytical engine of Babbage, which was designed to calculate and print tables of a function from constants, but was never actually constructed. (d) Tide-predicting machines, of which several have been constructed, with one of which, that of Ferrel, the regular tide-tables published by the United States Coast Survey are now computed. (e) Machines for integrating differential equations, though these are rather instruments than machines. (f) Logical machines, for deducing conclusions from premises. There are also important instruments for performing calculations, which are not usually called machines. Such are the abacus, the celestial globe, and Hill's machine for predicting eclipses and occultations, used in the calculation of the American ephemeris. (See cut under *abacus*.) There are also various calculating-scales, such as Napier's bones. Many of these devices are of considerable utility, such as Airy's stick for gaging cylindrical vessels, and the gagers' rod. Some instruments perform calculations subsidiary to the process of measurement, as the *planimeter*.

calculation (kal'kü-lä'shôn), *n.* [*< ME. calculacion, -tion, < L. calculatio(n-), < calculare, reckon: see calculate, v.*] 1. The act of calculating; the art, practice, or manner of computing by numbers; reckoning; computation: as, to find a result by *calculation*; the *calculation* was a difficult one.

In rigorous logic, and by *calculation* carried far enough, the time must come when the dead in our country will outnumber and dispossess the living.

W. R. Greg, Misc. Essays, 1st ser., p. 105.

Whenever we term arithmetic the science of *calculation*, we in fact allude to that rudimentary period of the science of numbers when pebbles (*calculi*) were used, as now among savages they often are, to facilitate the practice of counting.

2. A series of arithmetical processes leading to a certain result.—3. An estimate formed in the

mind by comparing the various circumstances and facts which bear on the matter in hand.

Began to chafe as at a personal wrong.
Tennyson, Enoch Arden.

4. The habit of forming mental estimates; a trait or an element of intellectual character which shows itself in the habit of formulating and revolving schemes in the mind, or forecasting the progress or results of an undertaking.

Calculation might come to value love for its profit.

Emerson, Essays, 1st ser., p. 216.

Every virtue may take two shapes, the one lower and the other higher; for every virtue may spring from calculation, and on the other hand every act of virtue may be a religious act arising out of some worship or devotion of the soul.

In *pathol.*, a general term for inorganic concretions of various kinds formed in various parts of the body. Those concretions formed in the gall-bladder are called *biliary calculi*, or gall-stones; those formed by a morbid deposition from the urine in the kidneys or bladder are called *renal, cystic, or urinary calculi*; those formed in the substance of the lungs are called *pulmonary calculi*; and those formed in the salivary glands or their ducts are called *salivary calculi*. There are also gouty concretions called *arthritis calculi*, and others called *pancreatic calculi, lacrymal calculi, spermatic calculi, etc.*

3. In *math.*, any highly systematic method of treating a large variety of problems by the use of some peculiar system of algebraic notation. By the *calculus*, without qualification, is generally understood the *differential calculus*, invented by Leibnitz (although Newton's method of fluxions comes virtually to the same thing). In this method quantities are conceived as varying continuously, and when equations exist involving several quantities, these quantities will, in consequence of these equations, vary together, so that there will be equations between their rates of change, the differential or infinitely small increment of a variable being denoted by the letter *d* written before the symbol denoting the variable. The differential calculus treats of the values of

ratios of these differentials, and of the fundamental formulas into which these ratios enter. The *integral calculus* treats of integration, or the summation of an infinite series of differentials; it is largely an inverted statement of a part of the doctrine of the differential calculus, but it also introduces imaginary quantities and leads up to the theory of functions.—**Barycentric calculus.** See *barycentric*.—**Calculus of enlargement**, a method of obtaining algebraical developments, etc., by the use of *E* (see *calculus of finite differences*) and other symbols of operation.—**Calculus of equivalent statements.** Same as *calculus of logic*.—**Calculus of finite differences**, a method of calculating, mainly by means of the symbols *E*, Δ , and Σ : the first, *E*, signifying the operation of increasing the independent variable of a function by unity; the second, Δ , the increase in the value of a function produced by increasing its variable by unity; and the third, Σ , the operation of adding all values of the function for integral values of the variable from unity up. The calculus of finite differences differs from the differential calculus, not merely in considering finite differences instead of differentials, but also in not assuming continuity.—**Calculus of forms**, the theory of invariants, etc., treated symbolically after the manner of Gordan.—**Calculus of functions**, a branch of the calculus of finite differences; a method of finding functions which fulfil given conditions.—**Calculus of logic**, a method of working out conclusions from given premises by means of an algebraic notation.—**Calculus of operations**, the general method of treating mathematical problems by operating algebraically upon symbols of operation.—**Calculus of probability.** See *probability*.—**Calculus of quaternions**, the method of calculating by means of quaternions.—**Calculus of variations**, a branch of the differential calculus, using δ , the sign of the variation of a function, for the solution of problems of maxima and minima.—**Fluxional or fluxionary calculus.** See *method of fluxions*, under *fluxion*.—**Fusible calculus**, a variety of urinary concretion consisting of mixed ammonium-magnesium and calcium phosphates. It is so named because it fuses before the blowpipe.—**Imaginary calculus**, the method of calculating by the use of an imaginary unit, the square of which is supposed to be -1 , and which is added and multiplied like a number.—**Mulberry calculus**, a urinary concretion consisting chiefly of oxalate of lime. Many of these calculi in form and color somewhat resemble the fruit of the mulberry.—**Residual calculus**, a method of calculating by the operation called *residuation* (see *see*); a branch of the integral calculus invented by Cauchy.

caldera (kal-dā'rā), *n.* [*Sp.*, a kettle: see *cal-dron*.] A large kettle or caldron; hence, in *geol.*, an amphitheatrical depression in a volcanic formation. The term was originally used in describing volcanic regions occurring where Spanish is the current language, and was introduced by Von Buch in his classic description of the Canaries. Its use has been extended thence to other countries, and by it is understood a large amphitheatrical or kettle-like depression occurring in volcanic rocks, surrounded by high and steep walls, which are usually more or less broken away on one side or cut through by deep ravines (*barrancas*). Calderas are generally admitted to be volcanic craters enlarged by the action of the sea after submergence of the mass, or by the action of subterranean disruptive forces.

From the crest of the great escarpment of the Atrio (of Monte Somma), or what the Spaniards would call the "Caldera," deep ravines or "barrancos" very near each other radiate outwards in all directions.

—**Calendar - amendment Act**, an English statute of 1751, which took effect in 1752, establishing January 1st as the beginning of each year (instead of Lady-day, March 25th), adopting the Gregorian or "new style" in place of the Julian or "old style" calendar, and canceling the then existing excess of 11 days by making the 3d of September, 1752, the 14th. Also known as *Lord Chesterfield's Act*.

Part of a Calendar of the 13th century (July).—From portal of Amiens Cathedral.

—**Calendar month**, a solar month as it stands in almanacs.—**Calendar moon**. Same as *ecclesiastical moon* (which see, under *ecclesiastical*).—**Ecclesiastical calendar**, an arrangement of the civil year employed by the liturgical churches to designate the days set apart for particular religious celebration. As many feasts of the church depend upon Easter, the date of which varies from year to year, either the calendar must vary every year or must contain simply the matter from which a true calendar can be computed for each year. In the Roman Catholic Church, special circumstances in the history of each nation affect its liturgical calendar; hence every nation, and to some extent every religious order and even every ecclesiastical province, has its own calendar. The German Lutheran Church retained at the Reformation the Roman Catholic calendar, with the saints' days then observed. The Church of England still retains in its calendar certain festivals, called black-letter days, for which no service is prescribed, and which have been omitted by the Protestant Episcopal Church of America. See *Easter*.—**Gregorian calendar**, the reformed Julian calendar introduced by the bull of Pope Gregory XIII. in February, 1582, and adopted in England in September, 1752; the "new style" of distributing and naming time. The length of the year of the Gregorian calendar is regulated by the Gregorian rule of intercalation, which is that every year whose number in the common reckoning since Christ is not divisible by 4, as well as every year whose number is divisible by 100 but not by 400, shall have 365 days, and that all other years, namely, those whose numbers are divisible by 400, and those divisible by 4 and not by 100, shall have 366 days. The Gregorian year, or the mean length of the years of the Gregorian calendar, is 365 days, 5 hours, 49 minutes, and 12 seconds, and is too long by 26 seconds. The Gregorian rule has sometimes been stated as if the year 4000 and its multiples were to be common years; this, however, is not the rule enunciated by Gregory. The Gregorian calendar also regulates the time of Easter, upon which that of the other movable feasts of the church depend; and this it does by establishing a fictitious moon, which is purposely made to depart from the place of the true moon in order to prevent the coincidence of the Christian Paschal feast with that of the Jews.—**Hebrew calendar**, the luni-solar calendar used by the Jews since the second century of the Christian era. The years, numbered from the creation, are either ordinary, containing 12 lunar months and 353, 354, or 355 days, or embolismic, containing 13 lunar months and 383, 384, or 385 days. In every cycle of 19 years 7 are embolismic, to bring lunar and solar time into agreement. To find the number of the Hebrew year beginning in the course of a given Gregorian year, add 3761 to the number of the latter.—**Julian calendar**, the solar calendar as adjusted by Julius Caesar, in which the chronological reckoning was first made definite and invariable, and the average length of the year fixed at 365½ days. This average year (called the *Julian year*) being too long by a few minutes, the error was rectified in

the Gregorian calendar. The Julian calendar, or "old style," is still retained in Russia and Greece, whose dates consequently are now 13 days in arrear of those of other Christian countries.—**Mohammedan calendar**, the lunar calendar employed in all Mohammedan countries, though there is another peculiar to Persia. The years consist of 354 or 355 days, in the mean 354½. The beginning of the year thus retrogrades through different seasons, completing their circuit in about 33 years. They are numbered from the hejira (which see), the first day of the first year being July 16th, A. D. 622. The 1300th year began Sunday, November 12th, 1882.—**Republican calendar**, the calendar of the first French republic. The year consisted of 365 days, to which a 366th was to be added "according as the position of the equinox requires it," so that the year should always begin at the midnight of the Paris observatory preceding the true autumnal equinox. The numbers of the years were written in Roman numerals. The year I. began September 22d, 1792, but the calendar was not introduced until October 5th, 1793. Every period of four years was called a *francade*. The years of 366 days were called *sextile*. There were 12 months of 30 days each, and 5 or 6 extra days at the end called *sansculottides*. The names of the months, beginning at the autumnal equinox, were Vendémiaire, Brumaire, Frimaire, Nivose, Pluviose, Ventose, Germinal, Floréal, Prairial, Messidor, Thermidor, and Fructidor.

calender¹ (kal'en-dēr), *n.* [*< F. calandre, < ML. calendra, a calender, a corruption of L. cylindrus, a roller, cylinder*: see *cylinder*.] 1. A machine consisting of two or more cylinders or rolls revolving very nearly in contact, between which are passed woven fabrics, paper, etc., for preparation or finishing by means of great pressure, often aided by heat communicated from the interior of the cylinders. The object of the calender for cloth and paper is to give the material a perfectly smooth and equal surface, and sometimes to produce a superficial glaze, as in certain cotton and linen fabrics and what is specifically called *calendered paper*, or a wavy sheen, as in watered silk, etc. The larger rolls in such a calender are usually made of solidified paper or pasteboard turned exactly true, with intermediate cast-iron cylinders. Calenders are attached to paper-making machines for expressing the water from the felted web of paper, and for the finishing processes of smoothing and glazing. They are also used for spreading india-rubber into sheets suitable for making rubber fabrics, etc. 2. An establishment in which woven fabrics are prepared for market by the use of the calender and the other necessary processes.

It is as usual to say that goods are packed as that goods are dressed at a *calender*. *Encyc. Brit., IV. 682.*

Calender³, **Kalender** (kal'en-dēr), *n.* [= *F. calender, < Ar. qalandar, > Turk. qalander, Hind. qalandar*.] One of an order of dervishes founded in the fourteenth century by an Andalusian Arab named Yusuf, who was expelled from the order of Bektashis on account of his extreme arrogance. The Calenders are wanderers who preach in the market-places and live by alms. Though the title *Calender* asserts for its bearers a life of great purity, the members of this order, even before the death of its founder, fell into the grossest licentiousness and debauchery, and have not hesitated at assassination. They hold that salvation is as little affected by vice and crime as by virtue and holiness, and that sin stains the body only and can be removed by ablutions.

On the road I caused my beard and eyebrows to be shaven, and assumed a *calender's* habit.

=Syn. 2. *Calm*, *Placid*, *Tranquil*, *Serene*, *Quiet*, *Cool*, *Composed*, *Collected*, smooth, peaceful, unruffled, imperturbable. All the italicized words, when applied to the mind, still suggest the physical phenomena which they primarily denote. *Calm* implies that the mind remains unagitated, even by care and anxiety. There is a tendency to use the word to express the most complete mastery of the emotions; but it is also used for the mere outward manner: as, in spite of his anger, he remained calm. *Placid* is by derivation associated with the notion of pleasure; it generally applies to that which belongs to the nature, but is also especially used of the face: as, a placid smile. *Tranquil* implies not so much a mastery of self amid disturbing circumstances as freedom from that which agitates, a settled calm. *Serene*, by its association with the aspects of the sky, implies an exalted calm, a tranquillity that rises above clouds or storms. *Quiet*, when applied to the disposition, implies that the person is naturally silent and undemonstrative; externally it implies that one is free from annoyances: as, to leave him in quiet. Like *tranquil*, but unlike the rest, it is not suggestive of a triumph of self-control over natural agitation of feelings or confusion of mind. *Cool* is the opposite of *heated*; it indicates that state in which the heat of feeling is perfectly kept down, so that the intellectual faculties are not hindered from their best operation. *Composed* is applicable to the state of both thoughts and feelings, while *collected*, gathered together, can be used only with reference to the thoughts. *Composed* differs from *collected* also in expressing, like *calm*, merely a frame of mind; while *collected*, like *cool*, expresses a readiness for action with the full and unimpeded force of the mind. See *apathy*.

Calm me, my God, and keep me calm, . . .
Yes, keep me calm, though loud and rude
The sounds my ear that greet,
Calm in the closet's solitude,
Calm in the bustling street.

Calaba*, of the West Indies and Brazil, the keena, *C. tomentosum*, of Ceylon, the *C. Tacamahaca* of the Isle of Bourbon and Madagascar, and other species, furnish resins and oils, as well as strong and durable timber. The fruits of some species are edible.

In the ice-calorimeter the substance to be operated on is inclosed in a cavity of ice, and the quantity of heat is determined by observing the increase of volume due to the melting of a portion of the ice. In other forms the rise in temperature of a known quantity of some liquid, as water or mercury, or the amount of expansion caused in a known volume of mercury, is noted.

The theory of the *calorists*, as those who held this view were called, and called themselves, is now utterly disproved. *Pop. Encyc.*

calory (kal'ō-rī), *n.* [*F. calorie*, < *L. calor*, heat.] In *phys.*, the quantity of heat necessary to raise the temperature of a kilogram of water from 0° to 1° centigrade. It is the unit of heat ordinarily employed in calorimetry by modern physicists, instead of the thermal unit based on the English measures. (See *thermal*.) The small calory or thermal unit on the C. G. S. system is the heat required to raise the temperature of one gram of water from 0° to 1° C. Although this particular degree of the scale is always specified in formal

definitions, yet it is practically assumed that the specific heat of water is constant; so that if the calory were defined in terms of the degree from 20° to 21°, it would more accurately represent the meaning in use. Also spelled *calorie*.

The *Calorie* is equal to 41,593,010,000 ergs or 423.985 kilogrammetres. *A. Daniell, Prin. of Physics*, p. 317.

Rummaging Ground-beetle (*Calosoma scrutator*), with larva of *C. calidum*. (Natural size.)

C. scrutator, and *C. calidum* are other species of this widely distributed genus, commonly called ground-beetles. Also spelled *Callisoma*.

calote, *n.* Same as *calotte*.

Calotermes (kal-ō-tēr'mēz), *n.* [*NL.*, < *Gr. κάλος*, beautiful, + *L. termes*, *termes*, a wood-worm: see *termes*.] One of the principal genera of white ants or termites, of the family *Termitidae* or isopterous *Neoptera*. It contains both winged sexual individuals and apterous, fully developed, but sexually aborted individuals. *C. flavicollis* of southern Europe is an example.

The nests of species of *Calotermes* are the most incomplete; they only gnaw passages in wood, which mainly run in the direction of the axis of the tree. There is no special place for the queen. *Claus, Zool. (trans.)*, p. 560.

Calves'-tongue Molding, Kenilworth Church, England.

his "Institutes," are his doctrines of original sin, namely, that we derive from Adam "not only the punishment, but also the pollution to which the punishment is justly due"; of freedom of the will, namely, that man "in his present state is despoiled of freedom of will and subject to a miserable slavery"; of grace, or that "the Lord both begins and completes the good work in us," and gives us "both will and power"; of predestination, or "the eternal decree of God, by which he has determined in himself what he would have become of every individual of mankind"; and of perseverance, or the doctrine that all the elect will certainly be saved. Calvinism has, however, been materially modified since Calvin's day, and the name is applied to modern systems of theology which differ more or less widely from his system in each of these particulars. (See *Calvinist*.) Generally, Calvinism may be said to rest upon the absolute sovereignty of God over all his creatures. It is in a modified form the theological system of most Baptists, Presbyterians, and Congregationalists.

If Arminianism most commends itself to our feelings, Calvinism is nearer to the facts, however harsh and forbidding these facts may seem.

American Congregationalists and the so-called New School Presbyterians are generally moderate Calvinists.

first to fall. It may form the entire perianth, no corolla being present; or when there are several whorls of envelopes, they may so grade into each other that the calyx cannot be strictly separated from the bracts without and the petals within. The parts of a calyx when distinct are called sepals, and it is disepalous, trisepalous, etc., according to their number. When they are more or less co-

(c) In crinoids, the cup at the summit of the stalk or stem, whence the brachia radiate and on the surface of which is the mouth. The base of the calyx is the summit of the stem, which may be a modified joint or ossicle composed of confluent joints. See cut under *Crinoidea*. A comb. [Prov. Eng.]

—2. A ridge, hedge, or long earthen mound. [North. Eng.]—3. In *mach.*, a device for converting a regular rotary motion into an irregular, fast and slow, intermittent rotary or reciprocating motion. It properly includes the cam-wheel, plain or geared, the cam-shaft, the heart-wheel, the wiper-wheel, the eccentric. The simplest form is that of a heart-shaped, lobe-shaped, or otherwise eccentric wheel, which imparts motion to another wheel either by means of gearing or by rolling contact. Instead of following the irregular face of the cam-wheel, the friction-wheel may travel in a curved race or guiding path on the side of a cam-disk, as in the cam-wheel of a harvester. In another form of cam the face of the wheel is cut into gears or into projecting teeth that may engage another gear, or an arm or a pinion upon a shaft, to give a quickly changing rising and falling motion. Such cams are also called *wiper-wheels*, and are used to operate stamps and tilt-hammers. The heart-wheel accomplishes the same object, but in a less abrupt manner, while eccentric cams of various shapes may impart a slow thrust and quick return, as in many machine-tools. The wiper, a cam-shaped arm, is very generally used to operate the valves of beam-engines. The cam in some of its forms appears in a great variety of machines, wherever an irregular speed or motion or a rapid reciprocating motion is required, as in the harvester, printing-press, sewing-machine, etc. A cam-shaft is a shaft having tumblers or wipers. The heart-wheel is a heart-shaped cam. (See *eccentric*.) Cams for determining motion for cutting and tracing, as in certain machines, are called *shaper-plates*.—**Solid cam**, a form of cam employed when the series of changes in velocity and direction required are too numerous to be included in a single rotation of a cam-plate. The cam is formed on the surface of a cone, either parallel to the axis or spirally, and the cone as it revolves is made to travel also in the direction of its axis by means of a screw.

1. Elliptical cam, used for giving motion to the levers of punching- and shearing-machines. 2. The heart-cam or heart-wheel, much used in cotton-machinery to produce a regular ascent and descent of the rail on which the spindles are situated. 3. Form of cam much used in iron-works for setting in motion the tilt-hammers.

It was believed by the older botanists to be a mucilaginous fluid exuded between the wood and the bark, and organized into new wood and new bark. It is now known to be not a fluid, but a layer of extremely delicate thin-walled cells, filled with protoplasm and organized nutrient matter, and appearing like a thin film of mucilage. These cells develop on the one side into a layer of new wood, and on the other of new bark, while at the same time fresh cambium is formed for the continuation of the work. It is by the renewal of this process year after year that the increase of growth in the stem is effected, as indicated by its concentric rings. In the primary fibrovascular bundles of the stem a similar layer of cambium, with the same function, is always found between the woody and cribrate portions.

A large ruminant quadruped of the family *Camelidae*, genus *Camelus*, used in Asia and Africa as a beast of burden. There are two distinct species of camels: (1) The Arabian camel, *C. dromedarius*, with one hump, and four callosities on the fore legs and two on the hind legs. It is a native of Arabia, and is now known only in the domesticated state; it is used chiefly in Arabia and Egypt. There are several breeds or artificial varieties. The dromedary is one of these, being simply a "blooded" or thoroughbred camel of great speed and bottom, used as a saddle-animal, and comparing with the heavier and slower varieties as a race-horse does with a cart-horse; it is not a different animal zoologically speaking. (2) The Bactrian camel, *C. bactrianus*, with two humps, of which there are also dif-

ferent breeds. The name *camel* is sometimes applied to the species of the American genus *Auchenia*, as the llama, alpaca, and vicuña, collectively known as the camels of the new world. The Arabian camel is poetically called the ship of the desert. Camels constitute the riches of an Arabian; without them he could not subsist, carry on trade, or travel over sandy deserts. Their milk and flesh are used for food and their hides for leather, and their hair is a valuable article of trade and manufacture. By the camel's power of sustaining abstinence from drink for many days, due to the reserve it can carry in its peculiarly constructed cellular stomach, and of subsisting on a few coarse, dry, prickly plants, it is especially fitted for the parched and barren lands of Asia and Africa. Camels carry from 600 to 1,000 pounds burden.

2. A water-tight structure placed beneath a ship or vessel to raise it in the water, in order to assist its passage over a shoal or bar, or to enable it to be navigated in shallow water. It is first filled with water and sunk alongside the vessel, to which it is then secured. As the water is pumped out, the camel gradually rises, lifting the vessel with it. Camels have also been used for raising sunken vessels.—**Camel's hair**, the hair of the camel, from which very fine fabrics, especially shawls, are made in the East, and also carpets, tent-cloths, etc. In Europe it is used chiefly for mixing with silk. The best comes from Persia. The so-called camel's-hair pencils or brushes used in painting are not made of camel's hair, but commonly of hair from the tails of Russian and Siberian squirrels. See *brush*.—**Camel's-hair cloth**. (a) An Oriental fabric. See *putto*. (b) A French imitation of this fabric; a warm and light woolen cloth with a gloss, but having long hairs standing up upon it. *Dict. of Needlework*.—**Camel's-hair shawl**, a name often given in the United States to the camels' shawl.—**Camel's hay**. Cf. *camlet*.] A stuff used in the middle ages as a material for dress. It is commonly said to have been made of camel's hair, and imported from the East; but as it is repeatedly mentioned as a common and cheap stuff, it is probable that it was an imitation of the Eastern fabric. camenes (kam'en-ēz), *n.* [See *def.*] In *logic*, the mnemonic name of a mood of the fourth figure of syllogism, of which the major premise is a universal affirmative, the minor a universal negative, and the conclusion a universal negative proposition: as, Whatever is expedient is conformable to nature; nothing conformable to nature is hurtful to society; therefore, nothing hurtful to society is expedient. This mood was formerly considered by all (as it is still by some) logicians as belonging to the first figure, and as such was called *celantes*. When put into the fourth figure it was called *clamentes*, then *camentes*, then *camenes*, also *calemes*. Of the seven letters of the word *camenes*, six are significant. *C* signifies reduction to *celarent*; *a*, *e*, *e* indicate the quantity and quality of the premises and conclusion; *m* signifies transposition of the premises in reduction, and *s* the simple conversion of the conclusion.

cameo (kam'ē-ō), *n.* [*< It. cammeo, a cameo, = F. camée (> G. camee = Dan. kamee = Sw. kamé) and camaiou (see camaiou) = Sp. camafeo = Pg. camafeo, camaféio, camafeu (cf. MHG. gamahiu, chammachiu, a kind of diamond), < ML. cammæus, camahutus, camahotus; of unknown origin.*] 1. An engraving in relief upon a gem, a hard stone of moderate size, or a similar material, or the object itself so engraved, as distinguished from an *intaglio*; specifically, such an engraving upon a stone or a shell having two or three layers differing in color, such as an onyx, agate, etc., and so treated as to utilize the effect of the variety of coloring. Cameos on stone are called *stone cameos*, in contradistinction to the *shell cameos*, or those cut on shells which have superposed layers varying in color, such as the *Cassia rufa*, which gives red on sardonyx, the *Cassia madagascariensis*, white on dark claret, the *Cassia cornuta*, white on orange, the *Strombus gigas*, white on pink, and other tropical shells. Cameos in distinct bands of colors have been produced since about 150 B. C.; and some of the ancient examples, as the *Sainte Chapelle* agate, in Paris (13 by 11 inches), representing the apotheosis of Augustus, and the *Vienna onyx* (9 by 8 inches), representing allegorically the coronation of Augustus, surpass in size and in delicacy of execution the best modern specimens.

Hence—2. Raised or anaglyphic work in art on a miniature scale; specifically, the art of engraving small figures in relief: opposed to *intaglio*: as, a stone or shell cut in *cameo*; a vase ornamented in *cameo*.—**Cameo incrustation**, the production of casts in relief within a coating of flint-glass. It is made usually in the form of a box in two parts, connected by an extensible bellows-like arrangement serving to adjust the focus, and having one or more lenses fixed in the front. Photographic cameras are made in a great variety of shapes and sizes, according to use, as the *pocket-camera*, *copying camera*, *landscape-camera*, and *portrait-camera*; and many different forms of lenses, some of highly specialized types, are used. Provision is made for inserting in the back of the camera carriers or plate-holders containing the dry or wet sensitive plates or the paper films, etc., on which the photographs are taken. See *camera obscura*, below, and *photography*.

4. In *anat.*: (a) The so-called fifth ventricle of the brain, between the laminae of the septum lucidum. It consists of a solid prismatic piece of glass mounted upon a brass frame. The prism has its angles so arranged that the rays from the object appear reflected as shown below, and is covered at the top by a metallic eyepiece, the hole in which lies half over the edge of the prism, so as to afford a person looking through it a view of the picture reflected through the glass, and a direct view of his pencil or tra-

cing-point. In the figure the object to be traced, *f*, is opposite the perpendicular surface of the prism, *d c*, and the rays proceeding from *f* pass through this surface and fall on the inclined plane *c b*, which makes an angle with *d c* of 67½°; from this they are totally reflected to the plane *b a*, which makes an angle of 135° with *b c*, and are again reflected to the eye at *e* above the horizontal plane, which makes an angle of 67½° with the plane *a b*. The rays of light from the object proceeding upward from *h* toward the eye of the observer, he sees the image at *m*, and by placing the paper below in this place the image may be traced with a pencil. The brass frame of the prism has usually two lenses, one concave and the other convex, the former to be used in front between *f* and *d c* for near-sighted persons, and the latter at *e* for those who are far-sighted. The size of the picture may also be increased or diminished by lengthening or shortening brass tubes connected with the frame. This instrument has undergone various modifications. It is extremely convenient on account of its portability.—**Camera obscura** (Latin, dark chamber), an apparatus in which the images of external objects, received through a convex lens, are exhibited distinctly and in their natural colors on a white surface placed at the focus of the lens. The simplest form of this instrument consists of a darkened chamber, into which no light is permitted to enter except by a small hole in the window-shutter. An image of the objects opposite the hole will then appear on the wall, or on a white screen so placed as to receive the light coming from the opening. A convex lens may be fixed in the hole of the shutter. Portable cameras are constructed of various forms, but the design of them all is to throw the images of external objects, as persons, houses, trees, landscapes, etc., upon a plane or curved surface, for the purpose of drawing, the making of photographic pictures, or mere amusement. The surface on which the image is thrown may be covered with a sheet of paper, on which the figure may be traced by hand with a pencil; but the picture is most distinctly seen when the image is formed on the back of a silvered mirror. The figure represents a portable camera obscura. The camera obscura is often made in the form of a circular building capable of holding a number of people, who stand about a plain white table which is placed in the center of the structure, and on which the luminous image is projected by a lens on the roof. By turning the lens around, a panorama of the neighboring scenery is exhibited on the table. Cameras for use in sketching are made in the shape of a cone, with a lens and a reflecting mirror at the apex and a drawing-table inside. One side of the box is cut out, and at this opening the artist sits, partly enveloped by a dark curtain which serves to shut out extraneous light. See *optigraph*.

and directed toward the sun, the negative being placed near the lens and sheets of sensitive paper in the plane of focus. Copying cameras used with electric lights are also made of very great size, for producing life-size copies of portraits, the camera consisting essentially of a dark room in which the case holding the prepared paper travels along the plane of focus on rails laid on the floor.—**Delective camera**, a portable photographic camera adapted for making instantaneous pictures, especially of moving objects, while it is carried in the hand or otherwise about the person. The exposure is made by means of a spring, the object to be photographed being brought within the range of the lens by means of a finder variously devised.—**In camera**, in law, in chambers; in private: applied to a trial conducted with closed doors for some special reason touching the nature of the case or the evidence.—**Multiplying camera**, in photog., a camera fitted with a number of small lenses, so that it can take a number of pictures at one exposure. It is used for taking stereotypes.—**Solar camera**. See *copying camera*.—**Stereoscopic camera**, a double camera giving two pictures upon the same plate, or a camera with a single lens and a shifting device for effecting the same end.

(3) Inf. *can* (to *can*), assumed from the ind. form, occasionally used in mod. E. as a convenient substitute for *to be able*, or, as in the example cited from Bacon, analogously with *will* as an independent verb; *ME. inf. cunnen, cunne*, also *connen, conne* (usually 'to know,' rarely 'to can'), *< AS. cunnan*, scarcely used. (4) The ppr., *ME. cunning, kun-*

nyng, etc., earlier and north. form *cunnand*, is mod. E. *cunning*, with a partly deflected sense: see *cunning*, a., and *cunning*, n. (5) The pp. *couth* is found in mod. E. only in comp. *uncouth*, and deriv. *kith*, *kithe*, q. v.; ME. *couth*, *coud*, *cuth*, < AS. *cūth* (for **cūth*, like pret. *cūthe* above), known. 'beget, get' (pret. 'have gotten'), connected with AS. *cennan*, beget, produce, *cynn*, kin, *ge-cynd*, kind, etc., **ken*, L. **gen*, etc., but this root, though equally widely extended, appears to be fundamentally distinct from the root **ken*, know: see *ken*², *kin*¹, *kind*, *genus*, etc. Hence ult. *con*¹ (= *can*¹), *con*², *cun*¹, *cun*², *cunning*, *couth*, *uncouth* (= *unco*), *kith*, *kithe*, etc.] A. See *channel*¹ and *kennel*², doublets of *canal*.] 1. An artificial waterway for irrigation or navigation. Canals appear to have been first used for conveying water, and were merely shallow ditches with a slight fall. They naturally became, when large enough, a roadway for boats, and eventually for ships. A canal may be a mere cutting to unite bodies of water for the passage of boats, as in some of the chains of lakes in the eastern United States; or a continuous waterway formed by a series of long levels united by locks and carried over rivers and valleys by means of bridges, as the Erie canal; or a canalized river; or a navigable passage connecting lakes or seas, as the Welland canal in Canada, or the Suez canal. Among the longest canals are the Ganges canal in India, about 350 miles long, the Grand Canal in China, about 800 miles, and the Erie canal in New York, 363 miles. The James and Kanawha Rivers Navigation canal, 147 miles long, over-

came by its locks a grade of 1,916 feet, and the Morris canal in New Jersey, 101 miles long, one of 1,674 feet. The Suez canal (opened in 1869) is 90 miles long, and is level throughout. It is the largest ship-canal in the world in sectional area, and the most important in a commercial aspect. Canalized rivers are common in western Europe. On ordinary narrow canal boats are usually drawn by horses or mules traveling on a tow-path, though steam-propulsion and steam-towing are now used to some extent; larger ones, called *ship-canal*s, as the Suez, the North Holland, the Welland, etc., are navigated by vessels of different sizes, up to the largest under sail or steam.

The spaces are chiefly vascular channels, filled with connective tissue, fat, etc., between plates or layers of more compact bone-tissue. = Syn. 2 and 3. *Candid*, *Fair*, *Open*, *Frank*, *Ingenuous*, *Naïve*, *Sincere*, unprejudiced, unbiased. The first seven words apply to the spirit, expression, or manner. The *candid* man is able to look impartially on both sides of a subject, especially giving due weight to arguments or opinions opposed to his own, and due credit to the motives of opponents; *candid* speech is essentially the same as *frank* speech, sometimes going so far as to be blunt. *Fair* belongs primarily to conduct, but in regard to speech and thought it is the same as *candid*: as, a man preeminently *fair* in dealing with opposing views. *Open* is opposed to concealment; the *open* man does not cultivate a politic reserve, but expresses his opinions freely, without stopping to think of their effect upon his own interests. *Frank*, literally, *free*; the freedom may be in regard to one's own opinions, which is the same as *openness*, or in regard to things belonging to others, where the freedom may go so far as to be unpleasant, or it may disregard conventional ideas as to reticence. Hence, while *openness* is consistent with timidity, *frankness* implies some degree of boldness. *Ingenuous* implies a permanent moral quality, an elevated inability to be other than honest or open, even to one's own loss; there is a peculiar subjective cast to the word, as though the man stood most in awe of the disapprobation of his own judgment and conscience; hence the close connection between *ingenuousness* and *modesty*. *Naïve* expresses a real or an assumed unconsciousness of the way in which one's words meet conventional rules, or of the construction which may be put upon them by others; *naïveté* is thus an openness or frankness proceeding from native or assumed simplicity or artlessness. *Sincere* expresses the spirit and language that go with the love of truth; the *sincere* man is necessarily *candid* and *fair*, and as open and frank as seems required by truth.

States from Maine to Texas. The eggs are deposited upon trees. The larvae, after feeding upon the foliage for about a month, sometimes entirely destroying it, descend by threads to the ground, in which they burrow and undergo transformation, the moths issuing in April, or sometimes in March. The male is winged, but the female is wingless, and is obliged to climb up the tree-trunk in order to deposit her eggs. Hence, an obstructive bandage, oil-tough, or tarred band placed about trees is a common mode of protecting them. The fall canker-worm, *Anisopteryx pomataria*, is more distinctively a northern species. The moths issue mainly in the fall, and the eggs are exposed. See *geometrid*, *measurer*, and *span-worm*.

And oft he lets his canker-worms light

(Cannon are made of iron, brass, bronze, steel, or steel wire, and their projectiles weigh from 1 pound up to 2,000 pounds and more. The caliber or power of cannon may be expressed (1) by the weight of the*

shot fired: as, a 32-pounder; (2) by the diameter of the bore: as, a 12-inch gun; or (3) by the weight of the gun itself: as, an 8-hundredweight gun; a 25-ton gun. Cannon may be classified according to the service for which they are intended into mountain, field, siege, or sea-coast guns; according to the kind of fire they deliver, into guns, howitzers, and mortars; according to the kinds of projectiles used, into smooth-bore and rifled; and according to the methods of loading, into muzzle- and breech-loaders. weighing more than 100 tons have seldom been constructed. Cannon of the smaller calibers are mounted on wheeled carriages for service as field-pieces. In the United States army the cannon in service are 3-, 3.2-, 3.6-, 5-, 7-, 8-, 10-, and 12-inch breech-loading rifled guns, and 3.6-, 7-, and 12-inch breech-loading mortars. A breech-loading, rifled, coast-defense gun of 16-inch caliber has been built. The charge for this gun is 640 pounds of smokeless powder, and the projectile weighs 2,400 pounds. The 3.2-inch gun is a steel field-piece. In the United States navy, 6-, 8-, 10-, 12-, and 18-inch steel guns have been adopted for ships of recent design. The principal parts of a cannon of old pattern are: 1st, the *breech*, which is the mass of metal behind the bottom or end of the bore; 2d, in muzzle-loading cannon, the *cascabel*, a projection in rear of the base-ring, including the *knob*, the spherical part between the knob and the base-ring being called the *base of the breech*; 3d, the *reinforce*, the thickest part of the cylinder, extending from the base-ring forward; 4th, the *trunnions*, which project on each side, and serve to support the cannon; 5th, the *bore*, the interior of the cylinder, wherein the powder and shot are lodged, and which may be smooth or rifled; 6th, the *muzzle* or *mouth* of the bore. In modern breech-loading ordnance we have also the *breech-plug* with its mechanism. Cannon were formerly classed as whole cannons, demi-cannons, culverins, sakers, etc. See *gun*.

2. In *mach.*, a hollow cylindrical piece through which a revolving shaft passes, and which may revolve independently, and with a greater or less speed than that of the shaft. The canoes of savage races are constructed of bark (as the birch-bark canoe of the American Indians) or hides, or formed of the trunks of trees, excavated by burning or cutting them into a suitable shape. The birch-bark canoes are light and can be carried on the shoulders, one large enough for four per-

sons sometimes weighing no more than 40 or 50 pounds. The modern canoe, employed chiefly for pleasure, is a light boat, carvel- or clinker-built, sharp at both ends and with a beam one eighth or one sixth its length; it is usually

Various *canons*, which were made in councils held in the second century. *Hook.*

In the wording of a *canon*, it is not enough to admonish or to express disapprobation; its wording must be explicitly permissive or prohibitory, backed by the provision, expressed or admittedly understood, that its infringement will be visited with punishment. *The Churchman, LIV. 462.*

(b) In *liturgics*, that part of the liturgy or mass which includes the consecration, great oblation, and great intercession. It begins after the Sanctus (in the Roman liturgy, and other Latin liturgies influenced by the Roman, with the words *Te igitur*), and ends just before the Lord's Prayer, sometimes counted a

part of it. The Roman canon is divided into ten portions or paragraphs, generally named from their initial words. See *liturgy*.

3. The books of the Holy Scripture accepted by the Christian church as containing an authoritative rule of religious faith and practice. With the exception of the books called *antilegomena*, the canonicity of which was not at first universally recognized, the canon of the New Testament has always consisted of the same books. The books comprised in the Hebrew Bible, and constituting the Hebrew canon, that is to say, the books of the Old Testament as given in the authorized version from Genesis to Malachi inclusive, are universally recognized as canonical. The canonical character of the books not found in the Hebrew, but contained in the Septuagint or Vulgate, was disputed by many in the early church; and although they are received without distinction by the Greek Church, and, with the exception of some among the number, by the Roman Catholic Church, they are not accounted canonical by the Anglican Church (which, however, treats them as *ecclesiastical books*, that is, books to be read in the church), nor by any of the Protestant churches. See *antilegomena*, *apocrypha*, 2, *deuterocanonical*, and *ecclesiastical*.

4. The rules of a religious order, or of persons devoted to a strictly religious life, as monks and nuns; also, the book in which such rules are written.—5. A catalogue or list; specifically, the catalogue of members of the chapter of a cathedral or collegiate church.—6. A catalogue of saints acknowledged and canonized, as in the Roman Catholic and Eastern churches.

—7. In *art*, a rule or system of measures of such a character that, the dimensions of one of the parts being given, those of the whole may be deduced, and vice versa. A canon is established, for instance, when it is shown that the length of any well-proportioned figure is a certain number of times that of the head taken as a unit, and that the length of the head is contained a certain number of times in the torso or the legs. 8. In *music*, a kind of fugal composition in two or more parts, constructed according to the strict rules of imitation. One voice or instrument begins a melody, and after a few beats, the number depending upon the character of the melody, a second takes up the same melody at the beginning, at the same pitch or at some definite interval, and repeats it note for note, and generally interval for interval. The principle of the canon is that the second voice or instrument, when it begins the melody, must combine continuously, according to the strict rules of harmony, with that part at which the first voice has arrived, and when the third voice begins it must combine in the same manner with those parts at which the other two have arrived, and so on for any number of voices. A round is sometimes improperly called a canon.

Here we had a variety of brave Italian and Spanish songs, and a canon for eight voices, which Mr. Lock had lately made on these words: "Domine salvum fac Regem." *Pepys, Diary, I. 26.*

9. In *math.*: (a) A general rule for the solution of cases of similar nature. (b) An extensible table or set of tables. (c) A collection of formulas.—10. In *logic*, a fundamental and invariable maxim, such as, Nothing ought to be done without a reason.—11. In the *Kantian philosophy*, the science which determines the right use of any faculty of cognition: as, pure logic is the canon of the formal use of the understanding and reason; transcendental analytics is the canon of the use of the understanding a priori, and so on.—12. In *phar.*, a rule for compounding medicines.—13. In *Gr. hymnology*, a hymn consisting normally of a succession of nine odes, but usually of eight (sometimes of only three or four), the second being omitted, except in Lent, the numbers of the third, fourth, etc., however, remaining unaltered. See *ode*, *tetradion*, *tridion*.—14. Annual charge for use of land; rent; a quit-rent.—15. In *printing*, a large text printing-type, in size about 17½ lines to the linear foot: so called from its early employment in printing the canon of the mass and the service-books of the church.—*Ancyrene canons*. See *Ancyrene*.—*Apostolic canons*. See *apostolic*.—*Boole's canon*, in *math.*, a certain rule according to which a differential equation can be integrated if certain sufficient but not necessary conditions are fulfilled.—*Canon cancrizans*. See *cancerizans*.—*Canon law*, rules or laws relating to faith, morals, and discipline, enjoined on the members of any church communion by its lawful ecclesiastical authority; specifically, a collection of rules of ecclesiastical order and discipline embodied in the Corpus Juris Canonici (body of canon law). It is a compilation from the canons of councils, the decrees of the popes and fathers, and the decretals and canonical replies made to questions put at various times to the Roman pontiffs. The principal parts of which it consists are the Decretum, or collection of decrees made by Gratian A. D. 1151, and the decretals of Gregory IX., to which are added the decretals of Boniface VIII., the Clementine constitutions, and the books called the Extravagantes of John xxii. and the Extravagantes Communes. The canon law of the Church of England consists of canons passed in national and provincial synods and foreign canons adopted by custom and common law. The canon law of the Greek Church is embodied in the collections called the Syntagma Canonum, Nomocanon, and Synagoge Canonum of Photius. See *nomocanon*.—*Canon lawyer*, a person versed in the canon law.

Ovid was not only a fine poet, but (as a man may speak) a great Canon lawyer. *Selden, Table-Talk, p. 85.*

(b) A canon whose subject ends in a key one semitone above that in which it began, so that twelve repetitions traverse the circle of keys.—**Enigmatical canon**, **canon enigmaticus**, **riddle canon**, in *old music*, a canon in which one part was written out in full and the number of parts was given; the remaining parts were to be written out by the student in accordance with the requirements of an enigmatical inscription written upon the music. See *inscription*.—**Perpetual canon**, in *music*, a canon so constructed that it may be repeated any number of times without break in time or rhythm.—**Syn. Ordinance**, *Regulation*, etc. See *law*.

In the Roman Catholic Church in England and elsewhere canons were formerly divided into three classes, *regular*, *secular*, and *honorary*. The *regular canons* lived in monasteries, and added the profession of vows to their other duties. *Secular or lay canons* did not live in monasteries, but they kept the canonical hours. The *honorary canons* were not obliged to keep the hours. The name *foreign canons* was given to such as did not officiate in their canopies: opposed to *manicary or residentiary canons*. Canons of the English cathedrals must be in residence for three months each year. Collectively, with the dean at their head, they form the chapter. There are also canons of a lower grade, called *minor canons*, who assist in performing the daily choral service in the cathedral. *Honorary canons* may also be appointed, but receive no emolument.*

This use of the word *cañon* is peculiar to the United States, it being rare in Mexico, and not at all known in Spain or in Spanish South America. The word used in Spain and the Argentine Republic is *cañada*; in Peru, *quebrada*; and in Chili, *garganta*. A small and steep cañon, called in English *ravine*, *gorge*, or *gulch*, is known in Spain and Spanish America as *barranca* and *quebra*. = *Syn. Gorge*, etc. See *valley*.

In the Roman Catholic Church the canonical hours are the seven periods of daily prayer, viz., matins (consisting of nocturns with lauds), prime, terce, sext, none, evensong or vespers, and complin. canonization (kan'on-i-zā'shon), n. [= F. *canonisation*, < ML. *canonizare*, canonize: see *canonize*.] In the *Rom. Cath. Ch.*, the act of enrolling a beatified person among the saints.

See *beatification*. Originally each bishop was accustomed to declare that particular deceased persons should be regarded as saints; but the exercise of this power was gradually assumed by the popes, who since 1179 have exercised the exclusive right of canonization. In order to canonization, it must be shown that two miracles have been wrought by the candidate before beatification, and two more after it by his intercession. The pope, on application, resumes the case of the beatified person, with the view of testing his qualifications for the higher rank which is claimed for him. A secret consistory is summoned, at which three cardinals are appointed to inquire into the matter, who make their report at a second private meeting. In the third, which is a public consistory, one person, called *advocatus diaboli*, or devil's advocate, attacks the person to be canonized, raises doubts as to the miracles said to have been wrought by him, and exposes any want of formality in the procedure; while another person, called *advocatus Dei*, or God's advocate, supports his claim. Lastly, a fourth consistory is held, in which the votes of the prelates are taken for or against the canonization. If a plurality of votes are cast in favor of the candidate, the pope announces the day appointed for the ceremony, which takes place at St. Peter's. Also spelled *canonisation*.

canonize (kan'on-iz), v. t.; pret. and pp. *canonized*, ppr. *canonizing*. To speak with a whining voice or in an affected or assumed tone; assume a particular tone and manner of speaking for the purpose of exciting compassion, as in begging; hence, to beg.

—*Syn.* 2 and 3. *Cant*, *Slang*, *Colloquialism*. *Cant* belongs to a class; *slang* to no one class, except where it is specified: as, college slang; parliamentary slang. *Slang* is generally over-vivid in metaphor and threadbare from use, and is often vulgar or ungrammatical; *cant* may be correct, but unintelligible to those outside of the class concerned. *Cant* has also the meaning of insincere or conventional use of religious or other set phrases, as above. A *colloquialism* is simply an expression that belongs to common conversation, but is considered too homely for refined speech or for writing.

The *Cant* or flash language, or thieves' jargon, was scarcely known even by name in the United States until . . . some forty years ago.

Science, V. 380.

Women's caps are made of lace, muslin, ribbons, and other light materials, and sometimes cover both the back and sides of the head, as well as the top. They are worn as an indoor covering or ornament. Caps are in many cases made to serve, by their form, color, ornamentation, etc., as insignia of rank or dignity, or emblems of particular principles or occupations, as the ecclesiastical cap (see *biretta*), the cap of liberty (see *Phrygian cap*, below), the fool's cap, the nurse's cap, etc.

The square hole of the lower cap is fixed firmly on the tenon in the head of the lower mast, while the topmast traverses through the round hole. The topmast-cap is secured in the same way on the head of the topmast, the topgallantmast passing through the round hole. The bowsprit also is fitted with a cap, through which the jib-boom passes. (3) One of the square blocks of wood laid upon others on which the keel of a vessel rests in the process of building. The capels are sometimes themselves so impregnated with metalliferous particles as to be worth working; in such cases they are usually recognized as forming a part of the lode. If barren of ore, they are considered as belonging to the country. At the Mary Ann wheel (or mine) in Cornwall, and perhaps in other mines, the capel is called the *cab*; it is there described as consisting of chalcedonic quartz, and is considered as being a part of the lode, although barren of ore. The word is rarely heard outside of Cornwall. In the United States *casings* takes its place to some extent.*

Specifically, in *bot.*, resembling hair in the manner of growth: applied in this sense by Ray, Boerhaave, and other early botanists to ferns.

The quickness with which a withered slip revives on being placed in water, shows us the part which capillary action plays. H. Spencer, *Prin. of Biol.*, § 12.

5. Pertaining to the phenomena of the rise of fluids in tubes and chinks, and, more generally, to the collecting of liquids in drops,

their spreading over surfaces (as oil on water), and various other phenomena explicable proximately by surface-tension and ultimately by cohesion and adhesion, considered as forces acting at finite but insensible distances.—6. In *surg.*, linear: descriptive of a fracture of the skull without separation of the parts of the injured bones.—**Capillary antennæ**, in *entom.*, antennæ in which the joints are long, slender, and very loosely articulated, the outer ones being generally a little longer; this is regarded as a modification of the clavate type.—**Capillary attraction**, *capillary repulsion*, the excess or deficiency of the attraction of one of two fluids (the other being generally air) for the wall of a vessel with which they have a common line of contact. The common surface of the wall and of the more attracted fluid makes the acute angle with the common surface of the fluids. Capillary attraction is proximately accounted for by surface-tension; but the latter has to be explained by the attractions between the molecules of the fluids. See *capillary tubes*, below.—**Capillary bottle**, a bottle with a dropping-tube, used in preparing objects for the microscope.—**Capillary bronchitis**. See *bronchitis*.—**Capillary electrometer**. See *electro-capillary*.—**Capillary filter**, a simple water-filter, consisting of a cord of loose fiber, as a cotton candle-wick, one end of which is placed in the water, while the other end hangs over the edge of the vessel. The water is drawn through the cord by capillary action, without its impurities.—**Capillary pyrites**, in *mineral*. See *millierite*.—**Capillary repulsion**. See *capillary attraction*, above.—**Capillary tubes**, tubes with very small bores, of which the diameter is only a half, a third, a fourth, etc., of a line. If a tube of this sort, open at both ends, is taken and one of its ends immersed in water, the water will rise within the tube to a sensible height above the surface of the water in the vessel, the height being inversely as the diameter of the bore; that is, the smaller the bore the greater the height. Different liquids rise in capillary tubes to different heights. The rise is explained by the action of cohesion as a force acting at insensible distances (hence called *capillary attraction*), which produces a tension of the superficial film of the liquid (see *surface-tension*) that exerts a pull upward where the surface is concave, as when the tube is moistened by the liquid (as glass or metal by water, alcohol, etc.), but a pressure downward where the surface is convex; consequently, those liquids which do not adhere to or wet the surface of the tube immersed in them stand lower within than without. Mercury, for example, is depressed in a glass tube, but rises in one of tin, to which it can adhere. The oil rises in the wick of a lamp or candle by this principle.—**Capillary vessels**, in *anat.*, the capillaries.

II. *n.*; pl. *capillaries* (-riz). 1. A tube with a small bore. Specifically.—2. in 1820 by Temminck to the puff-birds, or American fissirostral barbets, of the family *Bucconidae*, and subsequently became, at the hands of other writers, a loose synonym of various genera of old- as well as new-world barbets, included in families known as *Megalemidæ*, *Capitonidæ*, etc. Its proper and now current sense is that here indicated. In Rome, and in Roman cities and colonies, the precinct and temple of Jupiter Optimus Maximus, the protector of the city. The Capitol at Rome, situated on the southwestern summit of the Capitoline hill, was the center of the official religion of the state. In it the cult of Juno and of Minerva was associated with that of Jupiter. It was three times destroyed by fire, and each time restored with augmented magnificence; the last edifice continued to exist, though despoiled, till about the tenth century. The whole of the Capitoline hill (originally Mons Saturnius or Tarpeius) was also called the Capitol; on the second of its two summits was the citadel. The modern Capitol, or museum of the Capitol, stands in the space between the summits. Meetings of the senate and other legislative bodies have been held in or on the Capitol in both ancient and modern times. Literary references or inscriptions prove the existence of a capitol on the model of that in Rome in more than twenty provincial cities of Italy, Gaul, Spain, Africa, and the East; and there can be no doubt that a similar foundation was established in every regularly constituted Roman colony. The Roman capitol of Toulouse, which has been more than once renewed, has been the chief seat of authority in that city from medieval times to the present day.

(*b*) *pl.* (1) The name given by Europeans to those treaties and concessions of the early sultans of Turkey which secure to foreigners residing there rights of exterritoriality, in continuation of similar privileges granted to foreign residents by the Byzantine empire.

These privileges are in general called *Capitulatio*; not in the sense now usual of a surrender of right, for they were a free grant, but in the old sense of an agreement under heads and articles—"Capitula." The word was not unusual in such a sense in old French treaties and conventions, for we read of a "*Capitulation* and Contract of Marriage" between Dom Pedro of Portugal and the Princess Marie of Savoy.

=*Syn.* 1. *Prisoner, Captive.* The word *prisoner* emphasizes the idea of restraint of liberty, but is not rhetorical or especially associated with feeling: the *prisoner* of war and the *prisoner* for crime may be shut up in a prison, kept by guards within defined limits, or given a restricted liberty on parole. The word *captive* suggests being completely in the power of another, whether confined or not; it has come to be a rhetorical word, suggesting helplessness and resulting unhappiness. Captured soldiers under guard are strictly *prisoners*, but are often and properly called *captives*. When we speak of a *captive* bird, we suggest its longing for liberty. The rights and interests of a *prisoner* are likely to be respected, but the *captive* may be abused or even sometimes sold into slavery. See *captivity*.

=Syn. *Imprisonment*, *Captivity*, *Confinement*, *Incarceration*, *Imurement*. There is the same distinction between *imprisonment* and *captivity* as between *prisoner* and *captive*. (See *captive*.) *Confinement* is the most general word for being kept within bounds against one's will, as by force or sickness; we speak of solitary *confinement*, and, figuratively, of too great *confinement* (though voluntary) to one's books. *Incarceration* is the being put into a jail or prison; the word is rhetorical, suggesting ignominy, with narrow range and great safeguards against escape. *Imurement*, literally shutting within walls, is now freely figurative; in either sense it suggests depth of separation or seclusion from friends, home, or the world, and small likelihood of getting or coming out. (See *servitude* and *serf*.)

So fare my limbs with long *imprisonment*.

Carapa (kar'a-pā), *n.* [NL. (*Pg. caraipa*), < *carai*, a native Guiana name.] 1. A genus of tropical trees, natural order *Meliaceae*. A South American species, *C. Guianensis*, is a fine large tree, the bark of which is in repute as a febrifuge. Oil made from its seeds (called *carap-oil* or *crab-oil*) is used for lamps. The wood, called *carapa-wood* or *crab-wood*, is light and takes a good polish; it is used for making furniture, and also for the spars of ships. The oil of the African species, *C. Touloucouina*, called *coondi*, *kundah*, or *tallicoona* oil, is used by the negroes for making soap and anointing their bodies, its taste being so bitter that it serves as a defense against bites of vermin. The oil of the South American *carapa* is used for the same purpose.

2. [*i. c.*] A tree belonging to this genus.

carat, karat (kar'at), *n.* [Early mod. E. also *carat* (simulating *carat*, *character*, a character, mark, stamp); = *D. karaat* = *G. karat* (MHG. *karāt*, *garāt*) = *Dan. Sw. karat*, < *F. carat* = *Pr. carat* = *It. carato* = *Sp. Pg. quilate*, OPg. *cui-rate* = *Turk. Pers. qirāt*, < *Ar. qirāt*, *qirāt*, a carat, the twenty-fourth of an ounce, four barleycorns, also a pod, husk (= *LL. cerates*), < *Gr. κέραιον*, the fruit of the locust-tree, also, like *L. siliqua* (see *siliqua*), a weight, the carat, also and lit. a little horn, dim. of *κέρας* (*keras*), a horn, akin to *E. horn*: see *cerato-* and *horn*.] 1†. An old weight equal to a scruple, or the twenty-fourth part of an ounce troy.—2†. A unit of mass formerly used in various countries for weighing gold. It was generally the 24th part of a mark of gold, and was subdivided into 12 grains. It was commonly equal to about 150.5 troy grains.

Hence—3. A twenty-fourth part: specifically used in expressing the fineness of gold when used as jewelry. Thus, pure gold being considered as 24 carats fine, if two, six, or ten twenty-fourths of alloy (commonly copper or silver) is present, the gold is said to be 22, 18, or 14 carats fine, and so on. The gold used by

jewelers is seldom over 18 carats fine, except in wedding-rings, the standard fineness of which is 22 carats. Gold of 18 carats fine is almost invariably used in mounting diamonds, while 14-carat gold is said to be ordinarily used in the United States for gold chains, etc.

4. A unit of weight for precious stones, divided by jewelers into 4 grains, called *diamond-grains*, but equal to about 3½ troy grains, 151½ English carats being taken as equal to an ounce troy. In 1877 the weight of the carat was fixed by a syndicate of London, Paris, and Amsterdam jewelers at 205 milligrams, or 151.76 carats to the troy ounce. Under the translated form *κεράριον*, or *ceratium*, *siliqua* was adopted by Constantine into the system of weights of the empire as ¼ of an ounce, equal to 180 milligrams. In Italy it remained as a part of the system of weights, in general with the same relation to the ounce and with nearly the same value. The Arabic *qirāt* was the 24th part of the *mithkal*, and was subdivided sometimes into 4, sometimes into 3 grains, its value for gems being very nearly 3 grains troy. The Castilian carat, ¼ of a Castilian ounce, or 3.164 troy grains, was like the rest of the Castilian system, adopted from the Arabs. From Spain this has passed to the rest of Europe and to America, with only small modifications, less than unlegalized units commonly undergo, under the name of the *Amsterdam* or *diamond carat*, which is usually divided into 64ths. Pearls are sold by the diamond-grain and not by the carat, while small baroque pearls, coral, rough garnets, and the inferior kinds of stones are sold by the ounce troy. The subdivisions of the carat are always expressed in fourths, eighths, sixteenths, etc.

carbolic (kär-bol'ik), *a.* [*< carb(on) + -ol + -ic*.] Pertaining to or derived from carbon or coal.—**Carbolic acid**, a substance ($\text{C}_6\text{H}_5\text{OH}$) found in that part of the heavy oil of coal-tar which distills over between 329° and 374° F. From this product of coal-tar it is almost exclusively prepared. It has feeble acid properties, but in chemical structure is allied to the alcohols, and belongs to a class of compounds called *phenols*. When pure it crystallizes in white or colorless needles, which have the odor of creosote and a burning taste. They deliquesce readily and become liquid. It is an irritant poison when taken in large doses, but in doses of from 1 to 3 grains it is used internally as a therapeutic agent. Its chief medicinal use, however, is as a disinfectant in antiseptic surgery, and as an external application to unhealthy sores, compound fractures, abscesses after they have been opened, and tissues that are exposed as a result of surgical operations. The action of the acid is not only to exclude germs that induce putrefaction, but also to destroy such as may have been admitted, for which reason it is introduced into the interior of the wound. Also called *phenic acid*.—**Carbolic-acid paper**, wrapping-paper saturated with stearin and carbolic acid, used for preserving meats, etc.

carbon (kär'bon), *n.* [= *F. carbone* = *Sp. carbono* = *Pg. carbone* = *It. carbonio*, < *NL. carbo(n-)*, carbon, mod. forms, in chem. sense; cf. *F. charbon* = *Fr. carbo* = *Sp. carbon* = *Pg. carvão* = *It. carbone*, a coal, coal, older forms, in orig. sense; < *L. carbo(n-)*, a coal, whether a glowing coal or a dead coal, charcoal.] 1. Chemical symbol, C; atomic weight, 12. An element found in nature in two distinct forms: the diamond, which is extremely hard, of high specific gravity (3.5), usually colorless and transparent, with brilliant adamantine luster, and crystallizes in octahedrons; and graphite, which is very soft, of low specific gravity (2), black and opaque, with metallic luster, and crystallizes in hexagonal plates. See *diamond* and *graphite*. Its physical properties vary greatly with its different forms. It is combustible, burning to carbonic acid (CO_2). In combination it is universally distributed through the animal and vegetable kingdoms being a constituent of every living tissue. By the action of heat on such tissues, with partial or complete exclusion of air, carbon is procured in amorphous form more or less mixed with other matters. Such products are animal charcoal, lampblack, wood charcoal, coke, and gas-carbon. The number of its compounds with the other elements is endless; and at present more compounds of carbon are known, probably, than of all other elements taken together. It is present in the atmosphere as carbon dioxide, or carbonic-acid gas, and in the same form in some mineral waters; it also appears in the salts called carbonates, as calcium carbonate in coral, in the shells of many sea-animals, in the common mineral calcite, including chalk, limestone, marble, etc., and as iron carbonate in the mineral siderite, etc.

2. The form of the diamond generally called *carbonado*; the black diamond.—3. In *electric lighting*, a carbon-point (see below).—**Bisulphid of carbon**. See *bisulphid*.—**Carbon dioxide**. Same as *carbonic acid* (which see, under *carbonic*).—**Carbon-points**, in *electric lighting*, two rods of very hard, compact carbon, between which the electric arc is formed, producing a light of great brilliancy. See *voltic arc*, under *arc*, and *electric light*, under *electric*.—**Carbon process**, in *photog.*, a process of producing photographic positive pictures in a pigment composed of carbon, in order to insure their permanency. The thin paper on which the impression from the negative is taken is coated with gelatin colored with the carbon pigment, and sensitized, usually with bichromate of potash. After exposure to light under the negative it is affixed face downward upon another sheet of paper, and is plunged with it into a hot-water bath, which detaches the first paper and leaves the gelatin film uncovered. The water dissolves those portions of the film which have not been rendered insoluble by the action of light through the transparent portions of the negative upon the sensitizing medium, and the more or less insoluble portions of the film form a positive picture, which is, however, reversed in its relations of right and left. If a second transfer of the film from its support, to restore these relations in the finished print, is required, the first transfer is not made to a paper surface, but to a sheet of glass, zinc, or caoutchouc. The same end may be accomplished without the second transfer, by stripping the negative film from the glass, and printing with its face outward, by reversing the right and left of the negative by the use of a prism, or by other de-

vices.—**Carbon spar**, a name given to several mineral carbonates, as carbonate of magnesium, of zinc, etc.—**Carbon telephone**, a form of telephone invented by Edison, in which the vibrations of the diaphragm of the mouth-piece produce, by variable pressure upon a piece of compressed carbon placed in the circuit, variations in the electric current which induce sonorous vibrations in the receiver.—**Gas-carbon**, a form of amorphous carbon which is produced in the retorts where coal is heated for the manufacture of illuminating gas. It forms an iron-gray deposit on the sides and upper part of the retort. It is extremely hard, and is a good conductor of heat and electricity. It is used in the preparation of carbon battery-plates, and also for the carbon-points used with the electric arc-light. Also called *coal-gas charcoal* and *gas-graphite*.

carbena (kär-bō'nā), *n.* [NL.: see *carbon*.] In mining, a mass of stanniferous rock, irregular in form, and not possessing the general character of a lode. Such a mass, however, is ordinarily subordinate to a lode in its immediate vicinity. The carbena is in some respects analogous to the "pipes" and "flats" of the North of England lead-mines. The carbena of the St. Ives lode in Cornwall, England, was one of the most remarkable of these occurrences, and one of the first to which this name was given. It was composed of feldspar, quartz, black tourmalin (schorl), tin ore (cassiterite), and some cupiferous ore. It also contained fluor-spar, which was not present in the lode itself.

carbonaceous (kär-bō-nā'shius), *a.* [*carbon* + *-aceous*.] Pertaining to or consisting of carbon; containing carbon or coaly matter.—**Carbonaceous shale**, a soft shaly rock through which coaly or bituminous matter is abundantly diffused in fine particles. Such shales are abundant in some parts of the United States, especially in the Devonian and Silurian series.

Carbonaro (kär-bō-nā'rō), *n.*; pl. *Carbonari* (-ri). [It., lit. (as *carbonajo*), a charcoal-burner, < L. *carbonarius*, a charcoal-burner, a collier, < *carbo* (*n.*) (> It. *carbone*), coal, charcoal: see *carbon*.] One of the members of a secret political society called the *Carbonari*, formed in the kingdom of Naples during the reign of Murat (1808-14) by republicans and others dissatisfied with the French rule. They were originally refugees among the mountains of the Abruzzi provinces, and took their name from the mountain charcoal-burners. Their aim was to free their country from foreign domination. After having aided the Bourbons in the expulsion of the French, the organization spread over all Italy as the champions of the national liberal cause against the reactionary governments. At one time the Carbonari numbered several hundred thousand adherents. They were concerned in the various revolutions of the times until crushed out by the Austrian power in Italy. About 1820 they spread into France, and played an important part in French politics until the revolution of 1830.

Louis Napoleon began as a Carbonaro and conspirator, and narrowly escaped the fate which terminated the course of his elder brother and removed at least one rival out of his way.

2. *pl.* The common name in the Cordilleran mining region of ores consisting in large part of carbonate of lead, and usually containing silver. This is an important class of ores in Colorado and Utah.—3. Same as *carbonado* or *bort*. [Rare.]—**Hard carbonates**, salts containing carbonic acid with iron for a base.—**Soft carbonates**, salts containing carbonic acid with a base of lead.

Also *carbonatation*.

carbon-black (kär-bōn-blak), *n.* A fine lamp-black used in making printing-inks and paints. It is made by directing the flames of gas-lamps, fed by natural gas from wells, against cold surfaces, and collecting by machinery the sooty deposit. It is almost pure carbon in a finely divided form.

carbon-button (kär-bōn-but'n), *n.* A small disk of carbon, usually of compressed lampblack, used in a form of telephone invented by Edison. The resistance which it offers to the passage of an electric current depends upon the pressure to which it is subjected, so that when it forms a part of a circuit of constant electromotive force the current strength will vary with variations of pressure on the disk. See *carbon telephone*, under *carbon*.

carbonic (kär-bōn'ik), *a.* [= F. *carbonique* = Sp. Pg. It. *carbonico*, < NL. *carbonicus*, < *carbo* (*n.*), carbon: see *carbon* and *-ic*.] Pertaining to carbon, or obtained from it.—**Carbonic acid**, CO₂, more properly called *carbonic anhydride* or *carbon dioxide*, a gaseous compound of 12 parts by weight of carbon and 32 of oxygen, colorless, without smell, 22 times as heavy as hydrogen, and existing in the atmosphere to the extent of 1 volume in 2,500. It is reduced to a liquid by high pressure and cold; and it is obtained as a solid white substance by means of the intense cold produced by the sudden expansion of the liquid when allowed to escape from pressure. It has a pleasant, acidulous, pungent taste, and aerated beverages of all kinds—beer, champagne, and carbonated mineral water—in part owe their refreshing qualities to its presence; for, though poisonous when taken into the lungs, it is harmless when taken into the stomach in moderate quantity. Dissolved in water, it forms a dibasic acid, CO(OH)₂, whose salts, the carbonates, are widely and abundantly distributed in nature. It is incapable of maintaining combustion or animal life, acting as a narcotic poison when present in the air to the extent of only 4 or 5 per cent. It is disengaged from fermenting liquors and from decomposing vegetable and animal substances, and is largely evolved from fissures in the earth, constituting the choke-damp of mines. From its weight it has a tendency to subside into low places, vaults, and wells, rendering some low-lying places, as the upas valley of Java, and many caves, uninhabitable. This gas is formed and given out during the respiration of animals, and in all ordinary combustion, from the oxidation of carbon in the fuel. It is evolved from the colored parts of the flowers of plants both by night and day, and from the green parts of plants during the night. In direct or diffuse daylight, plants absorb it energetically from the atmosphere through their leaves, and decompose it, assimilating the carbon, and returning most of the oxygen to the air.—**Carbonic-acid engine**. (a) A fire-engine from which water is ejected by the pressure of carbonic-acid gas, which is evolved in a chamber connected with the water-reservoir. (b) An engine which is moved by the expansive force of condensed carbonic acid.—**Carbonic-acid water**. See *aerated waters*, under *aerate*.—**Carbonic or carbonous acid**, a substance (CO) obtained by allowing carbonic acid to pass over red-hot fragments of charcoal, contained in a tube of iron and porcelain, and also by several other processes. It is a colorless, inodorous gas, a little lighter than air, has neither acid nor alkaline properties, is very poisonous, and burns with a pale-lavender flame. This substance is produced when a coal-fire burns with a smokeless flame, and the pale-lavender flame produced by its combustion may often be observed playing over such a fire.

Carbonidae (kär-bōn'i-dē), *n. pl.* [NL., < *Carbo* (*n.*) + *-idae*.] A name of the cormorant family. J. F. Brandt, 1839. See *Phalacrocoracidae*.

carboniferous (kär-bō-nif'e-rus), *a.* [*L. carbo* (*n.*), coal, + *ferre* = E. *bear*¹.] Containing or yielding carbon or coal. In *geol.*, almost exclusively used in designating that assemblage of strata from which the coal of England, France, Germany, and the United States is for the most part obtained. The Carboniferous series is of the Paleozoic age, and is the most recent portion of the Paleozoic. It is overlaid by the Permian rocks, which belong to the closing era of the Carboniferous age, and is underlaid by the Devonian. The Carboniferous, over large areas both in Europe and North Amer-

ica, is separable into three more or less distinct groups: the coal-measures, the millstone-grit, and the mountain limestone. The first of these three is a series of shales and clays, with which the coal-beds themselves are interstratified. This part of the series is sometimes several thousand feet in thickness, and the number and thickness of the intercalated coal-beds differ greatly in different regions. The millstone-grit is a detrital rock ordinarily quite silicious, and assuming all degrees of fineness, from that of a fine-grained gritstone to that of a coarse conglomerate. Its thickness varies greatly in various regions. The mountain limestone is a calcareous rock, often rich in fossils of marine origin, and sometimes having a thickness of over 3,000 feet. See *coal*, *coal-measures*, *millstone-grit*, and *mountain limestone* (under *limestone*). [In technical use, commonly with a capital.]

The term is also used for the slow transformation of wood into coal by natural processes.

2. Same as *carburization*.—3. Same as *carbonation*. Also spelled *carbonisation*.

carbonization-bed (kär-bō-ni-zā'shon-bed), *n.* In charcoal-burning, a rectangular wooden box, higher at the rear than at the front, containing wood covered with a layer of earth. It has a hearth at the front or lower end, and forms a kind of kiln; the fire gradually extends backward from the hearth, and the charcoal is withdrawn as fast as it is made.

Where other than hand-power is used, the brake consists essentially of the shoe and lever and some means (as a coiled spring, steam, compressed air, or the pressure of the air acting in a vacuum) for developing power and applying it to operate the brake-lever. When all the brakes of a train are operated together by a single application of power, the apparatus is called a *continuous brake*. The most important forms of such brakes are the Westinghouse brake and the vacuum-brake. (See *air-brake*.) It. carcinoma*), < *Gr. karkinos*, a cancer, < *καρκίνος*, affect with cancer, < *καρκίος*, a crab, cancer: see *carcinus* and *cancer*.] A tumor which grows more or less rapidly, tends to break down and ulcerate in its later stages, propagates itself in neighboring or more distant parts, and after excision very frequently recurs; a cancer, in the stricter sense of that word. A carcinoma is characterized microscopically by trabeculae and nodular masses of cells of epithelial form and origin, running in a stroma of tissue of mesoblastic origin. Several types are distinguished: (1) flat-celled epithelioma; (2) cylinder-celled epithelioma; (3) simple carcinoma (carcinoma simplex), a variety of glandular carcinoma forming nodular tumors of considerable consistency; (4) carcinoma scirrhosum, or scirrhous cancer, a variety forming very hard nodules of almost the consistency of cartilage; (5) carcinoma gelatinosum, or cancer with colloid degeneration of the epithelial parts; colloid cancer; (6) carcinoma myxomatodes, or cancer with the stroma consisting of mucous tissue; (7) cylindroma carcinomatodes; (8) carcinoma gigantocellulare; (9) melanocarcinoma. Certain pathologists exclude the epitheliomata from the carcinomata, and hold that the latter are not of epithelial origin, but are purely a mesoblastic formation. Some, again, founding the definition of carcinomata entirely on anatomical features, independently of histogenetic considerations, include in them the sarcomata alveolaria. The softer carcinomata are as a rule the more rapidly fatal. The earlier a cancer is removed, the greater is the prolongation of life and the chance of escaping a return. See *cylindroma*, *epithelioma*, *carcoma*.—**Alveolar carcinoma**. See *alveolar*.

strips by hand as they became full. In modern cotton-carding machines a loose roll of fibers, called a *lap*, is placed in guides and rests upon a roller, which as it revolves unwinds the lap and delivers it to the *feed-roll*, on passing through which it is seized by the card-teeth upon a small cylinder, called the *licker-in*, from which it is drawn by the teeth of the clothing of the main cylinder. Other small cylinders successively remove the fibers from and deliver them to the main cylinder. The tufts, tangles, or knots which are not loosened by the action of these cylinders project beyond the teeth of the main cylinder, and are caught by the teeth of a succession of wooden slats called *card-tops*, *top-cards*, or *top-slats*, from which they are cleared or stripped by hand or by mechanical devices. The fibers upon the main cylinder are laid parallel upon it, and are removed by means of the *doffer*, a cylinder moving in an opposite direction from the main cylinder and at a very much slower rate, and whose whole surface is covered by card-cloth. The cotton is stripped from the doffer in a thin continuous sheet of its full width, by means of a comb vibrating vertically in contact with the teeth of the doffer. This sheet of fibers is drawn together into a ribbon, traverses a funnel or trumpet, and is passed between successive pairs of rolls, which draw out and condense the silver, and finally deliver it into the can ready for the *drawing-frame*, where it is doubled and drawn preparatory to twisting or spinning. For fine work, the operation of carding is repeated. The preparatory card or cards are called *breakers*, and those machines on which the carding is completed are called *finishers*. The principle of the wool-carding machine is identical with that of the cotton-carding machine, and it is chiefly distinguished from the latter by a great number of small cylinders called *urchns*, which work in pairs and are called *workers* and *cleansers*. The worker is the larger of the two; it strips the wool from the large main cylinder, and is itself cleaned by the smaller cylinder or cleaner, which delivers the wool back to the main cylinder, when it is again seized by the next worker. Wool-fibers are oiled to facilitate carding and to prevent felt.

Extraordinary care, ordinary care. See the adjectives.—**Take care**, be careful; beware.—**To have a care**. See *have*.—**To have the care of**, to have charge of. = *Syn. Care, Concern, Solicitude, Anxiety*. *Care* is the widest in its range of meaning; it may be with or without feeling, with or without action; as, the care of a garden. In its strongest sense, *care* is a painful burden of thought, perhaps from a multiplicity and constant pressure of things to be attended to: as, the child was a great care to her. *Concern* and *solicitude* are a step higher in intensity. *Concern* is often a regret for painful facts. *Care* and *concern* may represent the object of the thought and feeling; the others represent only the mental state: as, it shall be my chief concern. *Solicitude* is sometimes tenderer than concern, or is attended with more manifestation of feeling. *Anxiety* is the strongest of the four words; it is a restless dread of some evil. As compared with *solicitude*, it is more negative: as, *solicitude* to obtain preferment, to help a friend; *anxiety* to avoid an evil. We speak of care for an aged parent, concern for her comfort, *solicitude* to leave nothing undone for her welfare, *anxiety* as to the effect of an exposure to cold. (For *apprehension* and higher degrees of fear, see *alarm*.)

= *Syn. Caricature, Burlesque, Parody, Travesty*. The distinguishing mark of a caricature is that it absurdly exaggerates that which is characteristic, it may be by picture or by language. A burlesque renders its subject ludicrous by an incongruous manner of treating it, as by treating a grave subject lightly, or a light subject gravely. Burlesque may be intentional or not. A parody intentionally burlesques a literary composition, generally a poem, by imitating its form, style, or language. In a parody the characters are changed, while in a travesty they are retained, only the language being made absurd. (See *travesty*.) In a burlesque of a literary work the characters are generally changed into others which ludicrously suggest their originals.

A mendicant friar of the order of Our Lady of Mount Carmel.

This mountain, overlooking the bay of Acre in northwestern Palestine, has been from early times a resort for hermits, and in 1156 Berthold, a Calabrian monk, in obedience to a professed revelation from the prophet Elijah, built there a tower and a church and gathered around him about ten companions. From this small beginning arose the Carmelite order. According to an early rule, the monks were to live in separate cells, to abstain from meat, and to observe a strict fast from the Exaltation of the Cross (September 14th) to Easter, Sundays being excepted. Owing to Mohammedan persecutions, the Carmelites abandoned Mount Carmel and established themselves in 1238 in Cyprus and elsewhere. In the sixteenth century St. Theresa, a Spanish lady of noble family, built a convent at Avila and established a discolored or reformed branch of the order, consisting of both monks and nuns, sometimes called *barefooted Carmelites*. The habit of the order is a cassock, scapular, and hood of brown color, and a white cloak, the hood covering the head and face and having holes for the eyes. In the United States there are convents of the order in the dioceses of Leavenworth, Newark, Pittsburgh, Baltimore, St. Louis, and New Orleans. I. n. The principal artery of the neck of the higher vertebrates. There are usually two carotids, right and left, giving off few if any branches in the neck itself, but supplying the head. In man, the right carotid arises in common with the right subclavian from the innominate artery; the left arises directly from the arch of the aorta; both ascend the neck nearly vertically, but somewhat diverging from each other, in front of the spinal column and on each side of the trachea, inclosed with the pneumogastric nerve and internal jugular vein in the carotid sheath, and divide opposite the upper border of the thyroid cartilage into the *internal* and *external carotids*; up to this division the right and left carotids are termed the *common carotids*. The *external carotids* are the outer of the terminal branches of the common carotids, supplying mainly parts of the head outside the brain-cavity; their branches are the superior thyroid, lingual, facial, occipital, posterior auricular, ascending pharyngeal, internal maxillary, and temporal arteries. The *internal carotids* are the inner of the terminal branches of the common carotids, ascending deeply along the side of the neck and entering the cavity of the cranium through the carotid canal in the temporal bone, supplying the brain and associated structures. (See cuts under *embryo* and *lung*.) A similar arrangement of the carotids is substantially repeated in mammals. In birds the disposition of these arteries varies much, but in most cases there is but one carotid, the left, or sinistrotarotid. Also *carotis*.

II. a. Of or pertaining to the two great arteries of the neck: as, the *carotid canal*. Also *carotic*.—**Carotid arteries.** See **I.**—**Carotid canal**, the passage by which the internal carotid artery enters the cavity of the cranium; in man, a sinuous canal through the petrous portion of the temporal bone.—**Carotid foramen.** See *foramen*.—**Carotid ganglion**, a small sympathetic ganglion occasionally found on the under surface of the internal carotid artery while in the carotid canal.—**Carotid gland**, in *embryol.*, the termination of the first or anterior primitive aortic arch, whence the internal and external carotids arise.—**Carotid groove**, the sigmoid groove on either side of the body of the sphenoid bone where the internal carotid artery and cavernous sinus lie. Also called *cavernous groove*.—**Carotid nerve.** (a) A branch of the glossopharyngeal which accompanies the internal carotid artery. (b) The large deep petrosal nerve. (c) The sympathetic nerve running up along the internal carotid artery from the first cervical ganglion.—**Carotid plexus**, the plexus of sympathetic fibers lying on the outer side of the internal carotid while in the carotid canal.—**Carotid sheath**, a membranous envelop en-sheathing the common carotid artery, internal jugular vein, and pneumogastric nerve.—**Carotid tubercle**, the prominent anterior tubercle of the transverse process of the sixth cervical vertebra, against which the common carotid artery may be compressed.—**Cerebral carotid artery.** Same as *internal carotid*. The swains were preparing for a carousal.

Sterne, *Tristram Shandy*, vii. 43.

=**Syn.** *Revel*, *Carousal*, *Wassail*, *Spree*, *Debauch*, *Saturnalia*, *Orgy* agree in expressing times of excess in drinking; some of them include other sensual pleasures. They are in the order of strength and consequent reprobation implied. A *revel* is accompanied with some drunkenness,

disorder, and noise. A *carousal* is by derivation a time of drinking deeply; it may be a bacchanalian feast, a noisy, unrestrained drinking-bout. *Wassail* is limited by its associations with the past so as to be chiefly poetic or to express deep drinking. *Spree* is considered a colloquial word, but seems likely to win recognition as a convenient word for a period of drunkenness which incites to wild and reckless action. *Debauch* is distinctively excess, having less reference now than formerly to eating, applying chiefly to gross lewdness or drunkenness, which is often prolonged. *Saturnalia*, like *wassail*, has historical associations; it is a strong word for license, noisy revelry, gross and continued debauchery. *Orgy* is by derivation a secret nocturnal debauch, and by usage a time of joining in a wild or frantic abandonment to drunkenness or lust, or both—the extreme in that kind of misconduct. See *feast*.

O that men should put an enemy in their mouths to steal away their brains! that we should, with joy, pleasure, revel, and applause, transform ourselves into beasts!

There are numerous varieties, the most notable being (a) the normal form or *scale-carp* just described, (b) the *mirror-carp*, distinguished by very large scales below the dorsal,

A thick fabric, usually woven of wool, or of wool on a linen ground or back, and in more or less ornamental designs, used for covering floors, stairs, etc. Formerly the carpet (usually in a single

piece, like the Persian carpet) was also used (as it still is in the East) for covering beds, couches, tables, etc., and for hangings. (See *tapestry*.) The first woven carpets were produced in Egypt, Babylonia, Persia, and Hindustan, whence they were introduced into Europe, where they are supposed to have been first manufactured by the French in the reign of Henry IV., and next in England, at Mortlake in Surrey, in the reign of James I. The smaller carpets of the East are now commonly called *rugs*. See *rug*.

In the ordinary Brussels carpet both the pattern and the ground are left with the loops uncut; in the imperial Brussels carpet the pattern is raised above the ground, and its loops are cut so as to form a pile, those of the ground being uncut.—**Chenille carpet**, a carpet in which the weft is of chenille instead of yarn. The pattern is dyed in the chenille itself, nothing showing at the surface of the carpet but the ends of the chenille fringe.—**Felt carpet**, a carpet in which the fibers are matted or felted together without spinning or weaving.—**Ingrain carpet**, a carpet made of wool dyed in the grain, or before it is manufactured. It is called *Scotch* or (in England) *Kidderminster*, from the place where it is made, and *two-ply* or *three-ply*, according to the number of webs composing the fabric.—**Paper carpet**, a floor-covering (plain or in imitation of ornamental woods) made of a hard and tenacious paper called *hessian*, which is made by subjecting the paper-pulp to the action of chlorid of zinc and then to strong pressure, by which means the product is rendered hard and tough like leather.—**Persian carpet**, a carpet made in one piece, instead of in breadths or strips to be joined. The warp and weft are of linen or hemp, and the tufts of colored wool are inserted by twisting them around the warp all along the row according to the wearer's taste, no pattern being used. A line of tufts being inserted, a shoot of the weft is made, and then beaten up to close the fabric.—**Pile carpet**, a carpet made in the same way as Brussels carpet, but having its loops cut, thus forming a pile or soft surface.—**Printed carpet**, a carpet dyed or printed in colors; it is either woven in undyed colors and printed like calico, or the yarn is dyed in sections, which are adjusted according to their future position in the fabric.—**Scotch carpet**. Same as *ingrain carpet*.—**To be on the carpet** (more commonly on the *tapis*: see below), literally, to be on the tablecloth or table, as for consideration; hence, to be under discussion; to be the subject of deliberation or of intended action: a translation of the French phrase *être sur le tapis* (*tapis*, tablecloth, carpet, etc.: see *tapestry*).—**Turkish or Turkey carpet**, a carpet similar to the Persian, distinguished by the selection of the tufts of colored wool according to the pattern followed, and the manner of their attachment to the back. The cutting of the yarn gives it the appearance of velvet.—**Venetian carpet**, a carpet with a warp or chain of worsted, generally arranged in different-colored stripes.—**Wilton carpet**, a variety of Brussels carpet in which the loops are cut open into an elastic velvet pile: so named from being made originally at Wilton in England.

Specifically—2. One who for hire undertakes the conveyance of goods or persons. The law distinguishes between *common carriers* and *private or special carriers*. One who carries not as a business, but only on occasion by special agreement, is termed a *private or special carrier*. One who holds himself out as a carrier, inviting the employment of the public generally, is a *common carrier*. He is bound to serve without favoritism all who desire to employ him, and is liable for the safety of goods intrusted to him, except by losses from the act of God or from public enemies, or unless special exemption has been agreed upon; and in respect to the safety of passengers carried he is liable for injuries which he

might have prevented by special care. The most familiar classes of common carriers are railroad companies, stage-coach proprietors, expressmen, truckmen, ship-owners, steamboat-lines, lightermen, and ferrymen. The special rules of liability which the law, for reasons of public policy, imposes on common carriers have not been applied in their full extent to the business of drovers, owners of tow-boats, log-drivers, and others who do not literally carry the property intrusted to them; nor are telegraph companies deemed common carriers in respect to the messages they transmit.

Cartesian (kär-tê'zian), *a. and n.* [*< F. Cartésien* = *Sp. Pg. It. Cartesiano*, < *Cartesius*, Latinized form of *Cartes* in the name *Descartes* (*Des Cartes*), of which the first element is a removable prefix.] 1. *a.* Pertaining to the French philosopher René Descartes (1596-1650), to his philosophy, or to his geometrical method. In order to put philosophy on a sound basis, Descartes professed to begin by doubting all things. But the doubt, the thought, could not be doubted; hence the fundamental proposition of his philosophy, *Cogito, ergo sum* (I think, therefore I am). This proposition (which is not a syllogism nor any formal mode of inference) means that, recognizing the fact that I think, I am irresistibly led to believe and clearly to discern that I exist, without being able to account for the inference. According to Descartes, the consideration that the conception of a deity involves the conception of a reality surpassing my own leads to the irresistible belief and clear perception of the existence of a God. Also, since veracity is an attribute of God, all that is clearly and distinctly apprehended must be true. This is the so-called *Cartesian criterion of truth*. Substances, he taught, are of two radically different kinds: the *material*, which are extended and not conscious, and the *spiritual*, which are conscious and not extended—a doctrine which is called *Cartesian dualism*. The *Cartesian doctrine of divine assistance*, or *occasionalism*, which was not fully developed by Descartes himself, is that whenever the soul makes a voli-

tion God intervenes to cause the corresponding motion of the body. He also taught that brutes are mere machines without consciousness (the *Cartesian automatism*), and that all space is filled with matter, which turns about in vortices, and so produces the motions of the heavenly bodies.—**Cartesian coordinates**, in *geom.*, the lines introduced (1637) by René Descartes for defining the positions of points in a plane. Two straight lines, *Ox* and *Oy*, are adopted arbitrarily as *axes of coordinates*, to which all positions are referred. Their point of intersection, *O*, is called the *origin of coordinates*. From any point, *P*, whose position is to be defined, a line, *MP*, is drawn parallel to *Oy*, and meeting the axis *Ox* in *M*. The length *OM*, or the *abscissa*, being given, the position of *P* is determined: these lines are called the *Cartesian coordinates of the point P*. The term is sometimes extended to a similar system for three dimensions.—**Cartesian curve**.

See II., 2.—**Cartesian devil**, **Cartesian diver**, or **bottle-imp**, a philosophical toy used to illustrate the principle of specific gravity. It consists of a hollow figure, usually in the fancied form of a demon, with a hole at some distance from the top. The figure is filled with air in the upper part and with water in the lower, and floats in a tall glass vessel nearly full of water and covered air-tight with india-rubber or a piece of bladder. When this cover is pressed down, the air underneath is compressed, and water enters the figure by the hole so as to bring the air within the figure to an equal degree of compression. The figure consequently sinks, and does not rise again until the pressure is removed.—**Cartesian geometry**, geometry treated by means of coordinates; analytical geometry. See *Cartesian coordinates*, above.—**Cartesian lens**, a lens so shaped that there is no spherical aberration; especially, a concavoconvex lens having one surface spherical and the other ellipsoidal. Such lenses were proposed by Descartes, but never successfully executed, and were shown later to be needless.—**Cartesian measure of force**, the measure of force as proportional to the velocity, founded on the observation that the same force is required to raise one pound two feet as to raise two pounds one foot. Owing to the confused notions of force of Descartes and his followers, it is impossible to say whether the principle as enunciated by them is correct or not; but its errors appear, at any rate, to have been corrected in the final development of the doctrine, though it is now superseded.—**Cartesian oval**, a curve, the locus of a point whose distances from two fixed points are connected by any given

Cartesian Diver.

Confocal Cartesian Ovals.

F, F' are the foci; the ovals *a* and *A* form one quartic curve, likewise *b* and *B*, *c* and *C*, *d* and *D*; *x* is the intermediate circle, *y* the orthogonal circle.

linear equation. A Cartesian oval is a real branch of a Cartesian curve. These ovals were first imagined by Descartes in connection with the theory of optics. The evolute of a Cartesian oval is the diacaustic of a circle.

II. *n.* 1. One who adopts the philosophy of Descartes; a follower of Descartes.—2. Any curve of the fourth order having two cusps on the absolute. There are three genera of Cartesian ovals. The first consists of curves of the sixth class, composed of a pair of Cartesian ovals, one inside the other. The second genus consists of curves of the fourth class, which are limacons. Curves of this kind generally have an anacode which may become a crunode. The third genus consists of the cardioid, which is a curve of the third class with a real cusp. Every Cartesian has a single bitangent.—**Twisted Cartesian**, a curve in space, the locus of a point whose distances from three fixed points are connected by two linear equations.

Cartesians.

The full-line curve is a limaçon: without it and within the loop is a Cartesian of two ovals. On the other side of the limaçon is a Cartesian having only one real oval.

A crunode. The third genus consists of the cardioid, which is a curve of the third class with a real cusp. Every Cartesian has a single bitangent.—**Twisted Cartesian**, a curve in space, the locus of a point whose distances from three fixed points are connected by two linear equations.

One of a contemplative order of monks founded in 1086 by St. Bruno in the Grande Chartreuse, a wild mountain group in the diocese of Grenoble in France. They are remarkable for their austerity. They support themselves by manual labor, mendicancy being forbidden. Their habit is a haircloth shirt, a white tunic, and, when out of doors, a black cloak and a cowl. The order was introduced into England about 1180, and built the Charterhouse (corruption of *Chartreuse*, used as the generic name of any Cartusian monastery) in London in 1371. The monks of Chartreuse now derive a considerable revenue from the sale of the well-known cordial, of their invention, which bears the name of the monastery. (See *chartreuse*, 2.) The Cartusian nuns originated about 1280, and, with some modifications, follow the rules of the Cartusian monks.

cartilage (kär'ti-lä), *n.* [*< F. cartilage* = *Pr. cartilage* = *Sp. cartilago* = *Pg. cartilagem* = *It. cartilagine*, < *L. cartilago* (*cartilagin*-), gristle; origin unknown.] A non-vascular animal tissue belonging to the connective-tissue group; gristle. Typical hyaline cartilage is a translucent substance, of firm elastic consistence, constructed of roundish cells embedded in a nearly homogeneous intercellular substance. Fibrocartilage differs in that the intercellular substance becomes fibrillated; it thus approaches ordinary connective tissue. Reticular, yellow, or elastic cartilage, as that constituting in man the epiglottis, the cornicula laryngis, the Eustachian tube, and gristly parts of the outer ear, contains interlacing elastic fibers in considerable quantity. In the two latter forms the homogeneous substance remains unchanged in the immediate vicinity of the cells, forming their hyaline capsules. Chondrin, a substance resembling gelatin, may be extracted from cartilage by boiling. Cartilage usually persists in parts of the skeleton of adult vertebrates, as on the articular ends of bones, in the thorax, and in various passages which require to be kept open, as the windpipe, nostrils, and ears.—**Alar cartilage**. See *alar*.—**Articular cartilage**, an incrustation of hyaline cartilage on the articular ends or surfaces of bones, not covered by perichondrium on its free surface, with a finely granular matrix and small cells, showing no tendency to ossify, its density, smoothness, and elasticity contributing to the free movement of the parts.—**Arytenoid cartilages**, two triangular pyramidal cartilages, seated, one on each side, on the summit of the posterior portion of the cricoid cartilage. To them are attached the posterior ends of the vocal cords.—**Cartilage of Wrisberg**, a small cartilage on either side in the aryteno-epiglottic fold. Also called *cuneiform cartilage*.—**Carti-**

lages of Santorini, the horns of the larynx, or cornicula laryngis, borne upon the arytenoid cartilages. — **Cellular cartilage**, a variety of cartilage of which the notochord chiefly consists, composed almost entirely of large cells with the intercellular matrix at a minimum. — **Circumferential cartilage**, an annular piece of fibrocartilage forming a rim around and deepening some articular cavity, as in the shoulder-joint or hip-joint. — **Connecting cartilage**, a kind of fibrocartilage occurring in joints of slight mobility or none, as the pubic symphysis, the sacroiliac synchondrosis, and the intervertebral articulations. — **Costal cartilage**, the piece of cartilage which prolongs the bony part of a rib to or toward the sternum; a hemaphys; a sternal rib when unossified. In man all the ribs have costal cartilages; 7 of these reach the sternum, 3 are connected only with one another, and 2 form cartilaginous tips of the floating ribs. — **Cricoid cartilage**, the cricoid. — **Cuneiform cartilage**. Same as *cartilage of Wrisberg*. — **Dental cartilage**, the maxillary ridge (which see, under *maxillary*). — **Ensiiform cartilage**, the xiphoid appendage of the sternum; the last segment of the sternum, or the xiphisternum when unossified, as in man. — **Fibrous cartilage**, cartilage mixed with inelastic white or elastic yellow fibrous tissue: usually called *fibrocartilage* (which see). — **Hyaline cartilage**, true or pure cartilage or gristle. It is of a pale-livid or pearly-bluish color, and consists of roundish cells embedded in a nearly homogeneous intercellular substance, that is, unimixed with fibrous tissue. The articular and costal cartilages, and the temporary cartilages of the fetal skeleton, are of this kind. — **Interarticular cartilage**, a meniscus; a cartilaginous discoidal, crescentic, annular, or otherwise shaped piece occurring free in the interior of certain joints, and consisting of fibrocartilage, such as the semilunar cartilages of the knee-joint. In man interarticular cartilages occur in the temporomaxillary, sternoclavicular, acromioclavicular, ulnocarpal, and femorotibial articulations. — **Interosseous cartilage**, a piece of interarticular cartilage. — **Meckel's cartilage**. See *Meckelian rod*, under *rod*. — **Palpebral cartilage**. Same as *tarsal cartilage*. — **Permanent cartilage**, that which remains unossified throughout life. — **Semilunar cartilage**, one of the pair of large, free, crescentic interarticular cartilages of the knee-joint. See *cut under knee*. — **Sesamoid cartilage**, one of several small lateral cartilages of the nose. — **Siphon-hinge cartilage**, in cephalopods, one of two cartilaginous sockets on either side of the funnel, into which fleshy knobs of the mantle-skirt are fitted. — **Stratiform cartilage**, a layer of fibrocartilage in an osseous groove along which a tendon glides. — **Tarsal cartilage**, a piece of fibrocartilage embedded in the eyelid, contributing to preserve its shape. Also called *palpebral cartilage*. — **Temporary cartilage**, that cartilage which is replaced by bone in the process of ossification.

In *cartomancy*, the art of fortune-telling with packs of cards, there is a sort of nonsensical sense in such rules as that two queens mean friendship and four mean chattering, or that the knave of hearts prophesies a brave young man who will come into the family to be useful, unless his purpose be reversed by his card being upside down. E. B. Tylor, *Prim. Culture*, I. 114.

Colored cartoons intended to be woven in tapestry are cut in strips, placed under the web, and exactly copied by the weaver; the seven by Raphael, purchased by Charles I. of England, are well-known examples. 2. A picture, either a caricature or a symbolical composition, designed to advocate or attack some political or other idea of present interest or some prominent person: as, the *cartoons* of "Punch."

Sometimes written *carton*.

cartoon (kär-tōn'), *v. t.* [*cartoon, n.*] 1. In *painting*, to make a working design. See *cartoon, n.*, 1.

A roll or case of paper holding a charge for a firearm; a cartridge. — 2. A cartridge-box (which see). — 3. A case of wood bound about with marline, containing several iron balls of a pound each and about 400 musket-balls, to be fired from a cannon or howitzer. *Farrow, Mil. Encyc.* — 4. An oval or oblong figure on ancient Egyptian monuments and in papyri, containing groups of characters expressing the names or titles of royal personages and, rarely, of deities: a name given by Champollion. By extension it now commonly signifies both the inclosing ring and its contents. From a very early date, if not from the beginning, an Egyptian king at the moment of

coronation assumed, in addition to his family or personal name, an official, regal, or throne name, which took its place beside the former, generally preceding it, and thus gave occasion to a double cartouche. In imitation of the German *schilde* employed in a heraldic sense, the cartouche is in English sometimes styled a *shield* or *escutcheon*, or more often merely an oval.

Cartouche of Cleopatra.

Cartouche of Ramesses II.

Two names in an oblong inclosure called a *cartouche*. S. Sharpe, *Hist. Egypt*.

An elliptical curve, or oval, inclosing a name, always signified that the inclosed name was that of a king or queen; and Champollion gave it the name of *cartouche*, by which it is now called.

H. S. Osborn, *Ancient Egypt*, p. 21.

5. A painted, engraved, or sculptured ornament of irregular or fantastic form, inclosing a plain central space used as a field for inscriptions, etc. Such ornaments were much used during the sixteenth and seventeenth centuries to decorate waistcoats and the title-pages of books.

6. In *her.*, a name given in England to the oval escutcheon often seen in Italian heraldry, and generally considered to be peculiar to ecclesiastics. Italian escutcheons are often egg-shaped; but the shield designated by the word *cartouche* has both ends equally curved, and therefore approximates to an ellipse.

cartouset, n. A variant of *cartouche*. *Bailey*, 1731.

cartridge (kär'trij), *n.* [Formerly *cartrage*, a corruption of *cartouche*, *q. v.*] A case of pasteboard, parchment, copper, tin, serge, or other material, holding the exact charge of gunpowder, in the case of big guns, and of powder and bullet or shot for other firearms. — **Blank cartridge**, a cartridge without ball or shot. — **Blasting cartridge**. cartridge-gage (kär'trij-gāj), *n.* 1. In *artillery*, a flat steel gage for verifying the dimensions of metallic ammunition for small arms. The gage is pierced with holes giving the maximum and minimum diameters of the head and body of the shell, and the diameters of the projectile; on the edges are cut profiles for verifying the length and form of the cartridge-case and the thickness of the head, the length and form of the bullet, and the number and position of the cannelures.

In the United States the car-body is supported upon two independent trucks placed beneath it. Each of these may have two, but usually four, and occasionally six wheels fixed upon revolving axles, whose journal-boxes vibrate vertically in pedestals secured to the framework of the truck. The bolster or cross-beam which directly supports the car-body is in the middle of the framework, and is suspended from it by equalizing bars and suspension-straps, in such a way as to distribute the weight upon all the wheels and allow for the sway, or freedom of motion, essential to easy riding. Springs and brake mechanism are attached to the truck. —Side bearings of a car-truck. See *bearing*.

cart-saddle (kär'tsad'l), *n.* The small saddle put upon the back of a draft-horse when harnessed. *Skeat*.

cart-saddle (kär'tsad'l), *v. t.* [*ME. cart-sadelen*; from the noun.] To harness; yoke.

caruca, **carruca** (ka-rö'kä), *n.* [*ML. carruca*, a four-wheeled carriage, < *carrus*, a car: see *carl*. Cf. *carue*.] In ancient village communities in England—(a) A plow. (b) A plow-team of oxen, yoked four abreast.

Information from the same source (*Statistical Account of Scotland*) also explains the use of the word *caruca* for plow. For the construction of the word involves not 4 yoke of oxen, but 4 oxen yoked abreast, as are the horses in the *caruca* so often seen upon Roman coins. And the statistical account informs us that in some districts of Scotland in former times the ploughs were drawn by 4 oxen or horses yoked abreast; one trod constantly upon the tilled surface, another went in the furrow, and two upon the stubble, or white land. The driver walked backwards, holding his cattle by halters, and taking care that each beast had its equal share in the draught. *Seebohm, Eng. Vil. Community*, p. 63.

caruaga, **carruaga** (kar'ö-kä), *n.* [*ML. carruagium* (for **carruaticum*), also *carruagium* (after *OF. carruage*), < *carruca*, a plow: see *caruca*.] 1. The act of plowing.—2. A former tax on land or landholders, fixed at a specified sum on each carucate, or about 100 acres of land. It succeeded the Danegeld (which see).

The other remarkable matter of the year 1198 is the imposition of a *caruaga*—a tax of five shillings on each carucate or hundred acres of land.

Stubbs, Const. Hist., § 150.

Also formerly *caruaga*.

carucate, **carrucate** (kar'ö-kät), *n.* [*ML. carucata*, *carrucata*, < *carruca*, a plow: see *caruca*.] Formerly, as much land as could be cultivated by one caruca: usually about 100 acres, but the quantity varied according to the nature of the soil and the practice of husbandry in different districts. Also *carue*.

A trace at least of the original reason of the varying contents and relations of the hide and virgate is to be

found in the Hundred Rolls, as, indeed, almost everywhere else, in the use of another word in the place of hide, when, instead of the anciently assessed hideage of a manor, its more modern actual taxable value is examined into and expressed. This new word is *carucate*—the land of a plough or plough team.

Seebohm, Eng. Vil. Community, p. 40.

carue (kar'ö), *n.* [Later misread and miswritten *carve*; < *ME. carue*, < *OF. carue, caruee*, < *ML. carucata, carrucata*, a certain portion of land: see *carucate*.] A carucate (which see).

And a Carve of Land, Carucata terræ, or a Hide of Land, Hida terræ (which is all one), is not of any certain content, but as much as a Plough can plough in a Year, and there-with agrees Lambard verbo Hyde. And a Carve of Land may contain an House, Wood, Meadow, and Pasture, because by them the Ploughman and the Beasts of the Plough are maintained.

Anthony Lowe's Case (1610), 9 Coke, 123, 124.

Side Elevation and Section of Sleeping-car Truck.

A, flange of wheel; B, journal-box; C, brake-shoe; D, brake-head; E, bolster-spring; F, equalizing-bar spring; G, pedestal; H, check-chain; I, center-pin or king-pin; J, equalizing-bar; K, center-bearing inverted arch-bar; L, spring-beam; M, pedestal tie-bar; N, pedestal brace; O, end piece of truck-frame; P, wheel-piece.

And it was agreed that common way be appendant to a Carve of Land, . . . and so a Carve of Land consists of Land, Meadow, and Pasture, as it appears by Tiringham's case, 4 Coke, 37 b.

Mors v. Webb (1652), 2 Brownlow (& Goldsborough), p. 297.

Carum (kär'rum), *n.* [*NL.*, < *Gr. κάρον*, caraway: see *caraway*.] A considerable genus of plants, natural order *Umbelliferae*. carval (kär'val), *n.* [*Manx*, = *E. carol*, q. v.] A song, carol, or ballad, especially one on a sacred subject, among the peasantry of the Isle of Man. Also *carvel*.

The Manx have a literature—a native vernacular Gaelic literature. . . . This literature consists of ballads on sacred subjects, which are called *carvals*. . . . It was formerly the custom in the Isle of Man for the young people who thought themselves endowed with the poetic gift to compose carols some time before Christmas, and to recite them in the parish churches. Those pieces which were approved of by the clergy were subsequently chanted by their authors through their immediate neighbourhoods, both before and after the holy festival. Many of these songs have been handed down by writing to the present time. . . . The *carvals* are preserved in uncouth-looking, smoke-stained volumes, in low farm-houses and cottages situated in mountain gills and glens.

By severing the ends of the successive flowering stems a sweet sap is obtained, which is either boiled down into syrup and sugar, or made by fermentation into toddy, which yields arrack by distillation. The soft pith abounds in sago-like farina, which is made into bread or eaten as gruel. The outer part of the stem is hard, strong, and durable, and is much used for building and for agricultural implements; and the sheaths of the leaves yield a very strong fiber, known as *kittul fiber*, which is said to be indestructible.

Specifically.—5. In law: (a) A cause or suit in court; any instance of litigation: as, the *case* was tried at the last term. In this sense *case* is nearly synonymous with *cause*, which is the more technical term. *Case* includes special proceedings, as well as actions at law, suits in equity, and criminal prosecutions; and it implies not only a controversy, but also legal proceedings. More loosely, however, it is used for cause of action: as, he has a good *case*.

This false jure . . . sat in his Consistorie, And gat his doomes upon sondry *cas*. Chaucer, Doctor's Tale, l. 163.

Force a composition or wrangle out some broken title, or break the necke of the *Case* with a Prohibition. Purchas, Pilgrimage, p. 133.

(b) The state of facts or the presentation of evidence on which a party to litigation relies for his success, whether as plaintiff or defendant: as, in cross-examining plaintiff's witness, defendant has no right to go beyond the limits of the direct examination, for such inquiries are part of his own *case*. Called specifically *case on appeal*.

6. In *gram.*, in many languages, one of the forms having different offices in the sentence which together make up the inflection of a noun: as, the *nominative case*, that of the subject of the verb, as *he*, *dominus* (Latin); the *accusative* or *objective case*, as *him*, *dominum*; the *genitive* or *possessive case*, as *his* (John's), *domini*. These are the only cases in modern English, and the objective is not distinguished in form from the nominative except in a few pronouns. In addition to the three cases found in English, Greek and German have a dative, Latin has a dative, an ablative, and a vocative, and Sanskrit further an instrumental and a locative. The French has lost all case-distinction in nouns. Some languages, as the Finnish and Hungarian, have many more cases, even fifteen or twenty. All the cases but the nominative are called *oblique cases*.

7. A person who is peculiar or remarkable in any respect: as, a queer *case*; a hard *case*: sometimes used without qualification: as, he is a *case*. [Colloq.]

"Well, the General can tell you," says the hunter, glancing at that individual, "what a terrible hard *case* I've been." W. M. Baker, New Timothy, p. 114.

8. In *logic*, a proposition stating a fact coming under a general rule; a subsumption.—**Action on the case**, in law, a general form of action (the phrase being originally equivalent to *action on the circumstances*) adopted to enlarge the legal remedies at a time when forms of action existed for trespasses with violence and for debts resting in bond, but no form had been provided for wrongs without violence, such as negligence, or oral or implied promise. It became the most widely used of all common-law forms, and equally applicable to consequential injury to the real or personal property and to the personal character of the party by whom it was brought.—**Amistad case**, a noted case in the courts of the United States, in which Spaniards claimed as their slaves negroes who had been kidnapped in Africa, and who while

being carried to Cuba (in 1839) rose against their captors, took possession of the vessel, and after changing her course were taken by a United States vessel off the American coast. The courts held that they were free, and not pirates or robbers.—**Bankers' case**, or **case of the bankers**, the petition of Hornblée and others to the barons of the exchequer in 1691 (14 How. St. Tr., 1) for the payment of certain annuities granted by Charles II. to repay money originally loaned to him on the security of the revenues. On appeal, the House of Lords decided that the grant was binding upon his successor, and continued a charge upon the revenue.—**Bates's case**, an English prosecution (1606) of a merchant, in which the claim of James I. to impose duties as a personal prerogative was sustained: a question afterward settled the other way under Cromwell. Also called the *case of the impositions*.—**Bradlaugh's case**, a prolonged controversy (1881-86) over the claim of Charles Bradlaugh (a) to take a seat in the House of Commons without taking the oath required of members, he declaring that he did not acknowledge or believe in its obligation; and later (b) to have the oath administered. Two notable legal decisions were reached in the course of the controversy. In 1884 (12 Law Rep., Q. B. D., 271), in the case of Charles Bradlaugh v. Francis R. Gossett, sergeant-at-arms of the House of Commons, arising out of a resolution excluding plaintiff from the House until he should engage not to disturb its proceedings by demanding to take the oath as a member, it was held that courts cannot control the House in its administration of laws relating merely to its internal procedure, nor inquire into the propriety of a resolution restraining a member from doing in the House what he had a lawful right to do, and that action will not lie against the sergeant-at-arms for obeying such resolution. In 1885 (14 Law Rep., Q. B. D., 667), in the Court of Appeal, the case of the Attorney-General v. Bradlaugh, for penalties under the Parliamentary Oaths Act, for voting in the House without having been sworn as a member, it was decided that a member who does not believe in a Supreme Being, and upon whom an oath is binding only as a promise, is incapable of taking the prescribed oath; but if he goes through the form of taking it (as Bradlaugh did by administering the oath to himself at the bar of the House), he is liable for violation of the act.—**Burr's case**, the prosecution of Aaron Burr for treason against the United States, tried before Chief Justice Marshall in 1807.—**Calvin's case**, also called the *case of the postnati*, 1608 (2 How. St. Tr., 559; 7 Coke, 1), an action turning on questions of allegiance and natural-born subjects. It was brought to recover lands by Robert Calvin against Richard and Nicholas Smith, to which defendants pleaded that the plaintiff was an alien, and incapable of bringing the action, because he was born in Scotland, though after the crown of England descended to James I., who was also king of Scotland. It was argued by lawyers and judges of the greatest renown, including Lords Bacon, Coke, Ellesmere, Yelverton, and Warburton, and was decided in favor of the plaintiff.—**Case agreed**, or **case stated**, in law, a statement of facts agreed on by the parties, or made by another court, to be submitted merely for decision of a point of law.—**Case law**. See *Tichborne case*, below.—**Case of the seven bishops**. See *bishop*.—**Case reserved**, **case made**, a statement presenting points of law reserved by the judge or parties for decision by the full court.—**Civil rights cases**. See *civil*.—**Clinton bridge case**, an important litigation in the United States Supreme Court (1870), which established the doctrine by which railroad bridges may be said to have gained clear recognition of their rights of way in preference to the navigable waters crossed by them, through the power of Congress to regulate inter-state commerce.—**Criminal cases**. See *criminal*.—**Crown cases reserved**. See *crown*.—**Darnell's case**, a noted case in English constitutional law (1627), in which the imprisonment of Sir Thomas Darnell and four others, for refusing to subscribe to a forced loan, was sanctioned, the agitation resulting from which was followed by the granting of the Petition of Right.—**Dartmouth College case**, the leading American case (1819) on the vested rights of corporations, reported as Trustees of Dartmouth College v. Woodward (4 Wheaton, 518), deciding that a corporate charter, even though it be a British charter granted before the revolution, cannot be materially altered by a State legislature, it being a contract within the meaning of the provision of the United States Constitution which deprives the States of the power to impair the obligation of a contract.—**Dr. Bonham's case**, an important decision upon English constitutional law, rendered in 1609, in the case of Thomas Bonham v. the College of Physicians (8 Coke, 107), for false imprisonment. It was held that an act of Parliament which is against common right and reason, or is impossible to be performed, is void by the common law; also, that where the power to commit to prison is vested by patent or act of Parliament in parties not being a court, their proceedings ought to be of record, and the facts upon which such power is exercised are traversable.—**Dred Scott case**, a case of great historical importance among the events which preceded the abolition of slavery in the United States, in which the Supreme Court held (in 1857) that a free negro of slave ancestry was not a citizen, and could not sue or be protected as such in the United States courts. The statement that the Africans in America had long been considered a subordinate race having "no rights which the white man is bound to respect," which was contained in the opinion of the chief justice, gained universal attention as a point of attack in the controversy about slavery.—**Five per cent. cases**, a decision of the United States Supreme Court in 1884 (110 U. S., 471), holding that an act of Congress by which a percentage of the proceeds of land "sold by Congress" is reserved to certain public uses of a State does not include lands disposed of by the United States in satisfaction of military land-warrants.—**General case**, in math., that special state of things which is considered when, in studying an analytical expression, it is assumed that there is no peculiar relation between the constants denoted by letters. The general case may be very exceptional. Thus, in linear associative algebra, in the general case the vanishing of a product implies the vanishing of one of the factors, yet among the innumerable possible algebras there are but three in which such an inference is

valid.—**Hampden's case**. See *case of ship-money*, under *ship-money*.—**In case**, in the event or contingency; if it should so fall out or happen that; supposing.

A sure retreat to his forces, *in case* they should have an ill day or an unlucky chance in the field.

Bacon, Hist. Hen. VII.

Irreducible case, in math., the case in which a cubic equation has three real roots, when Cardan's method of solution involves imaginaries.—**Kendall's case**, a decision of the United States Supreme Court (1838), noted in American constitutional law, that the court may compel a cabinet officer to perform a ministerial duty.—**Kosztz's case**, the facts and resulting diplomatic correspondence (1853) by which the United States government maintained the claim that Martin Kosztz, a native of Hungary, was entitled to protection as an American citizen from seizure by the Austrian government while in Turkish jurisdiction, he having previously legally declared his intention to become an American citizen.—**Marbury's case**, a decision of the United States Supreme Court (1803), noted in American constitutional history, which established the power of that court to declare an act of Congress void for contravening the United States Constitution, and defined the extent to which members of the cabinet are amenable to the courts.—**McLeod case**, a controversy between the United States and Canada, arising out of the incident of the destruction of the American steamer *Caroline* by the Canadian authorities (1837), in the course of which a man was killed. McLeod was arrested as one of the attacking party, and was indicted (1841) in New York State for murder; but he proved an alibi, and was acquitted. Also called the *case of the Caroline*.—**Negro case**. See *Sommersett's case*, below.—**Shelley's case**, the decision in 1581 (1 Coke, 89-106), by all the judges of England, of the case of Nicholas Wolfe against Henry Shelley, in ejectment, involving questions upon the law of common recoveries. It is chiefly celebrated for a precise and clear statement by defendant's counsel of a previously well-established rule of law concerning the effect of the word "heirs" in certain conveyances, since known as the rule in Shelley's case. This rule, which is now regarded as a rule of interpretation rather than a rule of law, is to the effect that wherever there is a limitation to a man, which if it stood alone would convey to him a particular estate of freehold, followed by a limitation to his heirs or to the heirs of his body (or equivalent expressions), either immediately or after the interposition of one or more particular estates, the apparent gift to the heir or heirs of the body is to be construed as a limitation of the estate; that is to say, not a gift to the heir, but a gift to the person first named of an estate of inheritance, such as his heir may take by descent.—**Sommersett's case**, a famous habeas corpus case in England in 1772, before Lord Mansfield, brought on behalf of Thomas Sommersett, a negro. It established the principle that a slave brought upon English soil became thereby free. Also called the *negro case*.

—**Special case**, a statement of facts agreed to on behalf of two or more litigant parties, and submitted for the opinion of a court of justice as to the law bearing on the facts so stated. In Scots law, in civil jury causes, a special case differs from a special verdict only in this, that the special verdict is returned by the jury, whereas the special case is adjusted by the parties themselves, or by their counsel, and sets forth the special facts on which they are agreed without the evidence.—**Taltarum's case**, a noted decision in the English courts in 1473, establishing the power of a tenant in tail to convert the estate into a fee simple absolute by suffering a common recovery.—**Tennessee bond cases**, a name given to seventeen causes decided by the United States Supreme Court in 1885 (114 U. S. Sup. Ct., 663), wherein it was held that the statutory lien upon railroads created by act of the Tennessee Legislature, Feb. 11th, 1852, was for the benefit of the State, and not of the holders of State bonds issued under that act.—**Tichborne case**, also called the *case of the claimant*, the name given to the history and proceedings of Thomas Castro, otherwise Arthur Orton, in his claim to be Sir Roger Tichborne, and heir to the estate and baronetcy of Tichborne in England (1868-74), which he prosecuted by suits in Chancery and in the Courts of Probate and of Common Pleas, and which culminated in his trial and sentence to fourteen years' imprisonment for perjury. The case is celebrated for the conflicting nature of the testimony as to his identity, and for the great public interest excited by it.—**To put the case**, to suppose the event or a certain state of things; state a question, especially in a manner to invite decision.—**Tweed's case**, the proceedings against William M. Tweed and others, known as the Tweed Ring, for frauds perpetrated while they were municipal officers of New York, by which they obtained over six million dollars from the county of New York. In a civil case it was decided by the Court of Appeals of New York in 1874 (People v. Ingersoll, 58 N. Y., 1) that an action for money fraudulently obtained from a county could not be brought in the name of the people of the State. This was subsequently remedied by statute, and a judgment obtained. In a criminal case, Tweed was found guilty on twelve counts for similar offenses in one indictment, and was separately sentenced to one year's imprisonment on each, with the direction that service of one sentence should not begin until the completion of service on a prior sentence. After completing the term of his first sentence, a writ of habeas corpus was served on his jailer, and the Court of Appeals in 1875 (People ex rel. Tweed v. Liscomb, 60 N. Y., 559) decided that, under the statutes conferring the power to sentence, cumulative sentences in such cases were not lawful, and discharged him; but he was immediately imprisoned in default of bail in preceding civil suits. Other minor decisions on questions of procedure are also included under this term.—**Twyne's case**, the leading case in English law (1603) holding that a conveyance intended to defraud creditors is void as against them, if not taken in good faith and for valuable consideration.—**Tytrel's case**, a noted decision in English law (1558), in which after Parliament, by the statute of uses, had thought to put an end to the holding of land in the name of one person to the use of another, the courts introduced the doctrine of a use upon a use, leading to the present law of trusts.—**Virginia coupon cases**, the generic name under which are known a number of suits determined by the United States Supreme Court in 1884, enforcing a Virginia statute which declared coupons on bonds of that State receivable in payment of State taxes, notwithstanding

the repeal of that statute.—**Wheeling bridge case**, the case of Pennsylvania v. Wheeling and Belmont Bridge Co., decided by the United States Supreme Court (in 1851 and 1856), concerning a bridge across the Ohio river at Wheeling, Virginia. After holding in 1851 (13 How., 518), by a divided court, that a bridge, though entirely within the jurisdiction of the State that authorized its construction, could be enjoined as a nuisance by the courts of the United States if it obstructed inter-state navigation, the court held in 1856 (18 How., 421) that Congress, under the constitutional power to regulate commerce between the States, may determine what shall or shall not be deemed an obstruction to navigation, and may declare a bridge, when erected, to be a lawful structure so as to avoid the effect of its having been judicially declared a nuisance.—**Wild's case**, an English decision, in 1599 (6 Co. Rep., 16 b), in the case of Richardson v. Yardeley, in ejectment: so called because involving a devise to one Rowland Wild, which established the rule for the construction of wills known as the rule in Wild's case, viz., "that if A devises his lands to B and his children or issues, and he hath not any issue at the time of the devise, that the same is an estate tail."—**Syn.** Situation, condition, state, circumstances, plight, predicament.

caste² (kást), *n.* [Formerly *cast*, only recently as F. *caste*, < Pg. *casta* (> Sp. *casta*), breed, race, caste; first applied to the classes of the Hindus by the Portuguese, who were the earliest colonists in India; prop. fem. of *casto*, < L. *castus*, pure, > OF. *chaste*, E. *chaste*, *q. v.*] 1. One of the artificial divisions or social classes into which the Hindus are rigidly separated according to the religious law of Brahmanism, and of which the privileges or disabilities are transmitted by inheritance. The principal castes are four in number: 1st, the Brahmans, or the sacerdotal caste; 2d, the Kshatriyas, modern Rajputs, or military caste; 3d, the Vaisyas, or husbandmen and merchants, who have now in many districts become merged in the second and fourth castes; 4th, the Sudras, or laborers and mechanics. The Brahmans are supposed to have sprung from the mouth of Brahma, the Kshatriyas from his arms, the Vaisyas from his belly and thighs, and the Sudras from his feet. The Brahman represents religion; the Kshatriya, war; the Vaisya, commerce and wealth; and the Sudra, labor. There are many subdivisions of caste, and although the Sudras are degraded far below the Brahmans, Kshatriyas, and Vaisyas, there are reckoned thirty-six subdivisions lower than the Sudras. Lowest of all are the Pariahs, who are supposed to be of no caste, and mere outcasts from humanity. Of the castes, the first three are the natural and gradually established divisions of the Aryan invaders and conquerors of India; the fourth was made up of the subjugated aborigines. The Sanskrit name for caste is *varna*, color, the different castes having been at first marked by differences of complexion, according to race, and in some degree according to occupation and consequent exposure. Besides the original castes, numerous mixed classes or castes have sprung up in the progress of time, and are dependent upon trade, occupation, or profession; in fact, the essential principle in the system of caste is the confining of employments to hereditary classes. Castes are, according to Indian social standards, either "high" or "low." The same term is also used of somewhat similar classes in other countries.

The system of *caste* involves the worst of all wrongs to humanity—that of hallowing evil by the authority and sanction of religion. *Faiths of the World, p. 30.*

To be subjugated by an inferior caste was a degradation beyond all other degradation. *Macaulay, Hist. Eng.*

Offensive as is the low-caste Indian, . . . I had rather see the lowest Pariahs of the low, than a single trim, smooth-faced, smooth-wayed, clever high-caste Hindoo on my lands or in my colony.

W. G. Palgrave, in Fortnightly Rev.

Hence—2. A division of society, or the principle of grading society, according to external conditions; a class or grade separated from others by differences of wealth, hereditary rank or privileges, or by profession or employment.

Where the operations became hereditary, a system of *castes* arose. This system has never been rigid in Western Europe, however, as it has been in India and other countries of the East.

Her manner had not that repose

or no castles, properly speaking, till the time of William the Conqueror, after which a great many were constructed on the Norman model. At first the donjon or keep was the only part of the castle of great strength, and the other buildings in connection with it were of a more or less temporary nature. In the thirteenth century, however, the design of the castle became more fully developed, and the keep formed only the central part of a group of buildings, all supporting one another, and mutually contributing to the strength and commodiousness of the whole. The cut shows the castle of Coucy, near Laon, France, built in the thirteenth century. In the foreground is the outer bailey or esplanade, fortified, and containing a chapel, stables, and other build'ngs. The outer entrance to this was formed by a barbican or antemural (see plan under antemural). *a* is the foss, 20 yards broad; *b*, the gate, approached by two swing-bridges, defended by two guard-rooms, and having a double portcullis within, giving entrance to vaulted guard-rooms with sleeping-apartments, etc., above, *c*; *d*, inner bailey or courtyard; *e*, covered buildings for the men defending the walls or curtains; *f*, apartments for the family, entered by the grand staircase, *g*; *h*, great hall, with storerooms and vaults below; *i*, donjon or keep (the chapel is seen behind it), the strongest part of the castle, with walls of immense thickness, suited to form the last retreat of the garrison. At *k* is a postern leading from the donjon and communicating with an outer postern, drawbridge, etc.; *l*, *m*, *n*, *o* are the chief towers flanking the outer walls.

See cut under *cadenas*.—**A castle in the air, or in Spain**, a visionary project; a vague imagination of possible wealth, fame, happiness, or the like; a day-dream. (See below.)—**To build castles in Spain**, to build castles in the air. (See below.) The origin of this phrase (which is traced back in French literature to the thirteenth century, and in English to the fourteenth) is doubtful. It has been attributed to the boasting by Spanish adventurers in France of their lordly residences, which existed only in their imaginations; and less probably to a supposed prohibition at some time against the erection of fortifications in Spain. Littré thinks the idea is simply that of an imaginary castle in any foreign country, other names having been similarly used, and that of Spain prevailing as most familiar; to which may be added that its real origin is probably to be found in the notion, always prevalent, of the attainment of great wealth through emigration or foreign adventure.

Thou shalt make *castels* thanne in *Spainye*,
And dreame of joye, alle but in *vaïne*.
Rom. of the Rose, l. 2573.

The oil is afterward heated to the boiling-point, in order to separate the albumen and impurities. *Castor-oil* is used medicinally as a mild but efficient purgative. It is also used as a fixative in cotton-dyeing, especially in dyeing a Turkey-red color from madder. Casual ejector, in law, the name given to the defendant in the fictitious action of ejectment formerly allowed by the common law, where the real object of the action was to determine a title to land. To form the ground of such an action, the person laying claim to the land granted a lease of it to a fictitious person, usually designated John Doe, and an action was then brought in the name of John Doe against another fictitious person, usually designated Richard Roe (the casual ejector), who was stated to have illegally ejected John Doe from the land which he held on lease. The landholder was permitted to defend in place of Richard Roe, and thus the determination of the action involved the proving of the lessor's right to grant a lease. This fiction is now everywhere abolished. — *Syn.* 1. *Accidental*, *Chance*, etc. See *occasional*.

The original source of the name is unknown. It is supposed, as the cat was first domesticated in Egypt, that the word arose there, and being established in Italy, spread thence throughout Europe. The wildcat is much larger than the domestic cat, strong and ferocious, and very destructive to poultry, lambs, etc.

2. In general, any digitigrade carnivorous quadruped of the family *Felidæ*, as the lion, tiger, leopard, jaguar, etc., especially (a) of the genus *Felis*, and more particularly one of the smaller species of this genus; and (b) of the short-tailed species of the genus *Lynx*.

(b) A violent or inconsistent metaphor: as, to bend the knee of one's heart; to take arms against a sea of troubles. (c) In general, a violent or forced use of a word. — **2.** In *philol.*, the employment of a word under a false form through misapprehension in regard to its origin: thus, *causeway* and *crawfish* or *crayfish* have their forms by *catachresis*.

J. W. Dawson, Nature and the Bible, p. 161.

The French Revolution has been so often lifted by sensational writers into the region of *cataclysmal* and almost superhuman occurrences, that a narrative is especially acceptable which tends to range it among the facts which appeal to our ordinary experience.

The most celebrated of these subterranean vaults are those in and about this spot, the work of the early Christians. els, excavated in the soft granular tufa underlying the Campagna. In each wall loculi, or berth-like recesses, contained the bodies of the dead. The entrances to these were closed with slabs of stone, carefully sealed, and marked with inscriptions or rude pictures. In some cases small rooms, called *cubicula*, were set apart for families of distinction in the church, especially for martyrs. Though

these catacombs probably served to some extent as places of refuge and concealment for Christians during the earlier persecutions, the original idea of their construction was undoubtedly that they should be used only as burial vaults. The length of the galleries in the Roman catacombs has been variously estimated at from 350 to 900 miles, and the number of bodies there interred is said to be over 6,000,000. Similar underground burial-places are found at Naples, Cairo, Paris, etc. Those of Paris are abandoned quarries extending under a large portion of the city, which were made into a bonery in 1788, when the intramural cemeteries of the city were condemned and the bones were removed thither.

In the middle ages it was common to erect a canopy upon this, covering the coffin; the whole structure

was made somewhat to resemble an ecclesiastical edifice of the style then prevailing, and was allowed to remain for some little time after the ceremony. The modern *catalfalque* is generally without a canopy, and in Roman Catholic countries is surrounded by large tapers, which are burned during a day or two preceding the burial. The *catalfalque* is sometimes used as a hearse in carrying the body to the grave or tomb at a public or ceremonious funeral.

Life is | but an | empty | dream!

Verses consisting of feet of three or more syllables are described as *catalectic* in a syllable, a disyllable, or a trisyllable, according to the number of syllables in the last or incomplete foot.

If the first half of the line has its 12 short times, the second or *catalectic* part would seem to have but 11; but Aristoxenus, as we have seen, rejects the foot of 11 shorts as being unrhymical. *J. Hadley*, *Essays*, p. 105.

(b) In a wider sense, wanting part of a foot or measure: as, a *catalectic* colon; a verse doubly *catalectic*. See *brachycatalectic*, *dicatalectic*, *hypercatalectic*, and *procatalectic*.

catalexia (kat-a-lek'sis), *n.* [C. Gr. *κατάληξις*, an ending, termination (in prosody as in def.), < *κατάληγναι*, leave off: see *catalectic*.] In *pros.*, incompleteness of the last foot or measure of a verse; in a wider sense, incompleteness of any foot in a verse. *Catalexis* is not the suppression of any rhythmic element, but the want of a corresponding syllable or syllables in the words to fill out a time (mora) or times necessary to the metrical completeness of the line. This space is filled out by a pause—in the quantitative poetry of the Greeks and Romans, either by a pause or by prolonging the preceding syllable.

Lines therefore will be so divided into feet that the ictus shall always fall on the first syllable of each foot, admitting anacrusis and *catalexis* wherever necessary.

2. A decomposition and new combination supposed by Berzelius and other chemists to be produced among the proximate and elementary principles of one or more compounds, by virtue of the mere presence of a substance or substances which do not of themselves enter into the reaction. In *Rom. antiqu.*, a military engine used to throw darts of great size, called *phalarica* or *trifax*.

Catapult.

Its construction is nowhere explained with any fullness, and it is uncertain whether its action was that of a crossbow or whether springs were the propelling power. By later authors the catapult and ballista seem to be confounded. In the middle ages the name is hardly used, except where a writer is evidently seeking to give a classical form to his composition. In the annexed cut, which represents a catapult of the later period when no distinction was made between it and the ballista, *F* is the end of a strong lever, which revolves on an axis and is held down by a windlass, *A*. At the extremity is a fork, *E E*, with the prongs curving slightly upward so as to afford a bed for a barrel of combustible matter or a heavy missile confined by a rope with a loop at the end, the loop being passed through a hook, *D*. When the lever was released it bounded suddenly upward, the centrifugal force causing the loop *C* to slip off the hook, whereupon the barrel held on the fork was liberated and projected toward its object. *B* shows rings of iron, stone, or lead, intended to increase the rebound due to the stretched cables or other devices which furnished the propelling force.

Bring up the catapults, and shake the wall.

A secondary cataract is one due to an earlier disease of the eye. Cataracts are probably incurable except by surgical treatment. The lens is commonly entirely removed by an incision into the eye, or it is broken up with a fine needle and left to be absorbed.

The arrangement of actions or interconnection of causes which constitutes the final event of a dramatic piece; the unfolding and winding up of the plot, clearing up difficulties, and closing the play; the dénouement. The ancients divided a play into the protasis, epistasis, catastasis, and catastrophe; that is, the introduction, continuance, heightening, and development or conclusion.

Pat, he comes, like the *catastrophe* of the old comedy.
Shak., Lear, i. 2.

All the actors must enter to complete and make up the *catastrophe* of this great piece.

Sir T. Browne, Religio Medici, i. 47.

The *Catastrophe* of the Poem is finely presaged on this occasion.

Addison, Spectator, No. 327.

The *catastrophe*, indeed the whole of the last act, is beautifully written.

2. A notable event terminating a connected series; a finishing stroke or wind-up; specifically, an unfortunate conclusion; hence, any great calamity or disaster, especially one happening suddenly or from an irresistible cause.

Here was a mighty revolution, the most horrible and portentous *catastrophe* that nature ever yet saw.

Woodward, Ess. towards a Nat. Hist. of the Earth.

He fell, but one sufferer in a common *catastrophe*.

W. Phillips, Speeches, p. 6.

3. In *geol.*, an occurrence of geological importance not in harmony with preceding events, and not the result of causes acting always in a given direction; a cataclysm. It was once generally believed that the earth has "undergone a succession of revolutions and aqueous *catastrophes* interrupted by long intervals of tranquillity" (Lyell). The deluge was one of these great *catastrophes*. A similar view is the once common idea that all the living organisms on the earth's surface had been again and again exterminated, to be succeeded by new creations of plants and animals.

Great changes of a kind and intensity quite different from the common course of events, and which may therefore properly be called *catastrophes*, have taken place upon the earth's surface.

The old notion of all the inhabitants of the earth having been swept away by *catastrophes* at successive periods is very generally given up, even by those geologists, as Élie de Beaumont, Murchison, Barrande, etc., whose general views would naturally lead them to this conclusion.

Darwin, Origin of Species, p. 299.

Theory of catastrophes. See *theory of cataclysms*, under *cataclysm*. = Syn. 2. *Disaster*, *Calamity*, etc. (see *misfortune*); *consummation*, *finale*.

2. Relating to or in conformity with the views of the catastrophists; cataclysmal.

The hypothesis of uniformity cannot possess any essential simplicity which, previous to inquiry, gives it a claim upon our assent superior to that of the opposite *catastrophic* hypothesis.

3. Subversive in a momentous degree of settled usage or law.

The *catastrophic* creation of Peers for the purpose of swamping the upper house is . . . a power only to be used on great occasions, when the object is immense, and the party strife unmitigated.

Bagehot, Eng. Const. (Boston ed.), p. 305.

catastrophism (ka-tas'trō-fizm), *n.* [< *catastrophe* + *-ism*; = F. *catastrophisme*.] The theoretical view of geological events which has as its essential basis the idea of a succession of catastrophes: the opposite of *uniformitarianism*. See *catastrophe*, 3, and *cataclysm*, 2.

I find three, more or less contradictory, systems of geologic thought, each of which might fairly enough claim these appellations, standing side by side in Britain. I shall call one of them *Catastrophism*, another *Uniformitarianism*, the third *Evolutionism*. By *Catastrophism*, I mean any form of geological speculation which, in order to account for the phenomena of geology, supposes the operation of forces different in their nature, or immeasurably different in power, from those which we at present see in action in the universe. Huxley, Lay Sermons, p. 229.

catastrophist (ka-tas'trō-fist), *n.* [< *catastrophe* + *-ist*.] One who believes in *catastrophism*; a catastrophist. The term is used in geology by writers on theoretical dynamic geology as the opposite of *uniformitarian*, that is, of one who considers that geological causes now in action are, and have been, essentially the same from the beginning. The catastrophist maintains that there have been catastrophes, or sudden violent changes in the order of nature, such, for instance, as would cause the extermination of all forms of life upon the globe, or cover it with ice.

The *catastrophist* is affirmative, the *uniformitarian* is negative in his assertions.

For a generation after geologists had become uniformitarians in Geology, they remained *catastrophists* in Biology.
H. Spencer, Data of Ethics, § 17.

category (kat'ē-gō-ri), *n.*; pl. *categories* (-riz). [= F. *catégorie* = Sp. *catégorica* = Pg. It. *catēgoria*, < LL. *catēgoria*, < Gr. *κατηγορία*, an accusation, charge, later also a predicate or predicable, usually, in Aristotle and later writers, a category, predicament, head of predicables, < *κατηγορεῖν*, accuse, declare, assert, predicate, < *κατά*, against, < *ἀγορεύειν*, declaim, address an assembly, < *ἀγορά*, an assembly: see *agora*.] 1. In *logic*, a highest notion, especially one derived from the logical analysis of the forms of proposition. The word was introduced by Aristotle, who applies it to his ten predicaments, things said, or *summa genera*, viz., substance, quantity, quality, relation, action, passion, where, when, posture or relative position of parts, habit or state. These are derived from such an analysis of the proposition as could be made before the developed study of grammar. The *categories* or highest intellectual concepts of Kant are: *categories of quantity*—unity, plurality, totality; *categories of quality*—reality, negation, limit between these; *categories of relation*—substance and accident, cause and effect, action and reaction; *categories of modality*—possibility, impossibility, actuality, non-actuality, necessity, non-necessity. Modern formal logic furnishes this list: (1) qualities, or singular characters; (2) simple relations, or dual characters; (3) complex relations, or plural characters. Many lists of categories have been given not founded on formal logic.

The *categories*, or forms and conditions of human understanding, though doubtless innate in the naturalist's sense of the term, that is inherited, are only the ways and facilities of the higher exercise of the faculty of reflection. *C. Wright.*

The common *catenary* is what the *catenary* becomes when the forces are parallel and proportional to the length of the cord, as in the case of a heavy cord of uniform weight under the influence of gravitation. It is interesting on account of the light it throws on the theory of arches, and also by reason of its application to the construction of suspension-bridges.

II. *n.*; pl. *catenaries* (-riz). A *catenary curve*. **catenate** (kat'ē-nāt), *v. t.*; pret. and pp. *catenated*, ppr. *catenating*. [*< L. catenatus*, pp. of *catenare*, chain, < *catena*, a chain: see *catena* and *chain*.] To chain, or connect in a series of links or ties; concatenate.

E. *pill-bug* and *pill-beetle*).] 1. Properly, the larva of a lepidopterous insect, but also applied to the larvæ of other insects, such as members of the family *Tenthredinidae*, or saw-flies. Caterpillars are produced immediately from the egg; they are furnished with three pairs of true feet and a number of fleshy abdominal legs named *prolegs*, and have the shape and appearance of a worm. The old idea of Swammerdam that the pupa and imago are already concealed under the skin of the caterpillar is only partially founded in truth. The pupal skin is formed from the hypodermis of the larva, and the muscles contract and change its form. The larval skin is then thrown off, and the insect remains quiescent for some time, the imago or perfect insect forming beneath the pupal envelop. Caterpillars generally feed on leaves or succulent vegetables, and are sometimes very destructive. See *larva*.

(b) [*cap.*] Constituting, conforming to, or in harmony with the visible church, which extended throughout the whole Roman empire and adjacent countries, possessed a common organization and a system of intercommunion, and regulated disputed questions by ecumenical councils, as distinguished from local sects, whether heretical or simply schismatic, but especially from those which did not accept the decrees of ecumenical councils: as, the *Catholic Church*; the *Catholic faith*. In this sense it is regularly applied to the ancient historical church, its faith and organization down to the time of the great schism between the sees of Rome and Constantinople: as, a *Catholic* bishop or synod, as distinguished from a Nestorian or Jacobite prelate or council.

The importunity of heretics made them [the Church of Christ] add another name to this [Christian], viz., that of *catholic*; which was, as it were, their surname or characteristic, to distinguish them from all sects, who, though they had party names, yet sometimes sheltered themselves under the common name of Christians. Bingham, Antiq., i. i. § 7.

The test of *Catholic* doctrine, the maintenance of which distinguishes the *Catholic Church* in any place from heretical or schismatical communions, has been described as that which has been taught always, everywhere, by all. Blunt, Theol. Dict. (Episcopal).

(e) [*cap.*] Claiming to possess exclusively the notes or characteristics of the one, only, true, and universal church—unity, visibility, indefectibility, succession, universality, and sanctity: used in this sense, with these qualifications, only by the Church of Rome, as applicable only to itself and its adherents, and to their faith and organization; often qualified, especially by those not acknowledging these claims, by prefixing the word *Roman*. (f) More specifically, an epithet distinguishing the faith of the universal Christian church from those opinions which are peculiar to special sects. (g) A designation of certain of the epistles in the New Testament which are addressed to believers generally and not to a particular church. The measure was urged with special reference to the Roman Catholics of Ireland. —**Old Catholics**. (a) The name used by a small body of believers in Jansenism in Holland, with an archiepiscopal see in Utrecht. They have continued since 1723 to recognize the authority of the pope by sending him notice of each new election of a bishop, which he always disregards. (b) A reform party in the Roman Catholic Church, founded after the proclamation of, and in opposition to, the dogma of papal infallibility proclaimed by the Vatican Council in 1870. A schism with the Roman Catholic Church was not intended, but it resulted: the leaders were excommunicated and new congregations formed. No bishop having joined the movement, the ordination of a bishop was obtained from the Old Catholic bishop of Deventer in Holland. Old Catholics have departed in few respects from their former ecclesiastical customs as Roman Catholics. caucus (kâ'kus), *n.* [This word originated in Boston, Massachusetts. According to a com-

But such a corruption and forgetfulness of the orig. meaning of a word so familiar as *calkers* is improbable, and, moreover, the word *caucus* occurs at least 7 years earlier, in the following passage in the diary of John Adams: "Feb. . . ., 1763—This day learned that the *Caucus Club* meets at certain times in the garret of Tom Dawes, the adjutant of the Boston (militia) regiment." This indicates the origin of the term *caucus*, as a private meeting for political purposes, in the name of a club of that nature, called the "*Caucus Club*." The origin of the name as applied to the club is not known, but if not an arbitrary term, chosen for its alliterative form and feigned mysterious import, it may have been a learned adoption, in allusion to the convivial or symposiac feature of the club, of the ML. *caucus*, < MGr. *καῦκος* (also *καῦκη*, *καῦκα*, with dim. *καῦκιον*), a cup.] 1. In U. S. politics: (a) A local meeting of the voters of a party to nominate candidates for local offices, or to elect delegates to a convention for the nomination of more important officers. In the latter sense, caucuses are now generally called *primaries*. Admission to a party caucus is generally open only to known and registered members of the party. (b) A similar congressional, legislative, or other gathering of leading members of a party for conference as to party measures and policy. Candidates for the presidency and vice-presidency of the United States were nominated by party caucuses of members of Congress from 1800 to 1824.

More than fifty years ago, Mr. Samuel Adams's father, and twenty others, one or two from the north end of the town, where all the ship business is carried on, used to meet, make a *caucus*, and lay their plan for introducing certain persons into places of trust and power.

Gordon, Hist. of the Revolution (1788), I. 365.

A *caucus* (excuse the slang of politics) was held, as I am informed, by the delegations [of three Western States] for the purpose of recommending some character to the President [for Judge of Supreme Court].

John Randolph, quoted in H. Adams, p. 210.

cause (káz), *n.* [*ME. cause*, < *OF. cause*, also *cose*, a cause, a thing (*F. cause*, a cause, *chose*, a thing; see *chose*²), = *Pr. causa* = *Sp. It. causa*, *cosa* = *Pg. causa*, *coisa*, < *L. causa*, also spelled *caussa*, a cause, reason, in ML. also a thing; origin uncertain. See *accuse*, *excuse*.] 1. That by the power of which an event or thing is; a principle from which an effect arises; that upon which something depends per se; in general, anything which stands to something else in a real relation analogous to the mental relation of the antecedent to the consequent of a conditional proposition. Nominalist philosophers commonly hold that every effect is the result not of one but of many causes (see *total cause*, below); but the usual doctrine is that the effect is an abstract element of a thing or event, while the cause is an abstract element of an antecedent event. Four kinds of causes are recognized by Aristotelians: the *material*, *formal*, *efficient*, and *final cause*. *Material cause* is that which gives being to the thing, the matter by the determination of which it is constituted; *formal cause*, that which gives the thing its characteristics, the form or determination by which the matter becomes the thing; *efficient cause*, an external cause preceding its effect in time, and distinguished from *material* and *formal cause* by being external to that which it causes, and from the end or *final cause* in being that by which something is made or done, and not merely that for the sake of which it is made or done; *final cause*, an external cause following after that which it determines (called the *means*), the end for which the effect exists. Other divisions of causes are as follows: *subordinate* or *second cause*, one which is itself caused by something else; *first cause*, that which is not caused by anything else; *proximate* or *immediate cause*, one between which and the effect no other cause intervenes, or, in *law*, that from which the effect might be expected to follow without the concurrence of any unusual circumstances; *remote cause*, the opposite of *proximate cause*; *total cause*, the aggregate of all the antecedents which suffice to bring about the event; *partial cause*, something which tends to bring about an effect, but only in conjunction with other causes; *emanative cause*, that which by its mere existence determines the effect; *active cause*, that which brings about the effect by an action or operation, termed the *causation*; *immanent cause*, that which brings about some effect within itself, as the mind calling up an image; *transient cause*, that whose effect lies outside itself; *free cause*, that which is self-determined and free to act or not act: opposed to *necessary cause*; *principal cause*, that upon which the effect mainly depends; *instrumental cause*, a cause subservient to the principal cause. The above are the chief distinctions of the Aristotelians. The physicians, following Galen, recognized three kinds of causes, the *procatartetic*, *progenital*, and *synectic*. The *procatartetic cause* is an antecedent condition of things outside of the princi-

pal cause, facilitating the production of the effect; the *progenital cause* is that within the principal cause which either predisposes or directly excites it to action; and the *synectic*, *containing*, or *continuent cause* is the essence of the disease itself considered as the cause of the symptoms; thus typhoid fever might be referred to as the *continuent cause* of other-stools or a quickened pulse. Other varieties are the *occasional cause* (see *occasionalism*); *moral cause*, the person inciting the agent to action; *objective cause*, the ideas which excite the imagination of the agent; and *sufficient cause*, one which suffices to bring about the effect (see *sufficient reason*, under *reason*).

In virtue of his character as knowing, therefore, we are entitled to say that man is, according to a certain well-defined meaning of the term, a free cause.

T. H. Green, Prolegomena to Ethics, § 74.

Cause is the condensed expression of the factors of any phenomenon, the effect being the fact itself.

G. H. Leves, Probs. of Life and Mind, II. v. § 19.

Of these two senses of the word *cause*, viz., that which brings a thing to be, and that on which a thing under given circumstances follows, the former is that of which our experience is the earlier and more intimate, being suggested to us by our consciousness of willing and doing. *J. H. Newman*, Gram. of Assent, p. 66.

Specifically—2. An antecedent upon which an effect follows according to a law of nature; an efficient cause. The common conception of a cause, as producing an effect similar to itself at a later time and without essential reference to any third factor, is at variance with the established principles of mechanics. Two successive positions of a system must be known, in addition to the law of the force, before a position can be predicted; but the common idea of a cause is that of a single antecedent determining a consequent of the same nature. Moreover, the action of a force is strictly contemporaneous with it and comes to an end with it; and no known law of nature coordinates events separated by an interval of time.

3. The reason or motive for mental action or decision; ground for action in general.

2. The name given, usually with qualifying terms, to various coniferous trees, chiefly North American, and of genera nearly allied to *Cedrus*. The white cedar of the eastern United States is the *Chamaecyparis sphaeroides*, of swamps near the coast, and also

the arbor-vitæ, *Thuja occidentalis*; on the Pacific coast it is the *Libocedrus decurrens* (also known as *bastard*, *post*, or *incense cedar*), and also *Chamaecyparis Lawsoniana*, the Port Orford or Oregon cedar. The red cedar is usually the *Juniperus Virginiana*, the odoriferous wood of which is often called *pencil-cedar*, from its extensive use in the manufacture of lead-pencils; west of the Rocky Mountains the red cedar is the *Thuja gigantea*, also called *canoe-cedar*. The cedar of Bermuda and Barbados is *Juniperus Bermudiana*; the Japan cedar, *Cryptomeria Japonica*. The stinking cedars of the United States are species of *Torreya*. The Himalayan cedar is the *Juniperus exelsa*; its wood resembles that of the pencil-cedar, but is harder, and has less of its peculiar odor. Washington cedar is the big-tree of California, *Sequoia gigantea*. The wood of most of these trees is soft, fine-grained, of a reddish color, and often fragrant.

3. A name popularly given in tropical regions to a considerable number of trees, mostly of the natural order *Meliaceae*, in no way related to the preceding. That known variously as the West Indian cedar, the bastard or sweet-scented Barbados cedar, the Jamaica red cedar, and the Spanish, Havana, or Honduras cedar is the *Cedrela odorata*. The cedar of India and New South Wales is *C. Toona*; the red cedar of India, *Soy-mida febrifuga*; and the bastard cedar of India, *Melia Azedarach*. (See *azedarach*.) In India the name red cedar is sometimes given to the euphorbiaceous *Bischofia javanica*.

In *Rom. antiq.*, a body of knights or horsemen of the patrician order, numbering originally, according to tradition, 300, first organized by Romulus, 100 being selected, 10 from each curia, from each of the three tribes. Their commander was, from the time of Tullus Hostilius, the second officer of the state. Their number was gradually increased, and at the close of the dynasty of the Tarquins they were merged in the equites. The title was resumed under Augustus by the knights, as the body-guard of the emperor.

4. In *arch.* See *cella*, 1.—5. In *biol.*: (a) The fundamental form-element of every organized body. It is a bioplasmic mass of protoplasm, varying in size and shape, generally of microscopic dimensions, capable under proper conditions of performing the functions of sensation, nutrition, reproduction, and automatic or spontaneous motion, and constituting in itself an entire organism, or being capable of entering into the structure of one. Such a cell as a rule has a nucleus, and is usually also provided with a wall or definite boundary; but neither cell-nucleus nor cell-wall necessarily enters into its structure. In ultimate morphological analysis, all organized tissue is resolvable into cells or cell-products. See *protoplasm*, and *cell theory*, below. (b) Specifically, a nucleated capsulated form-element of any structure or tissue; one of the independent protoplasmic bodies which build up an animal fab-

ric; a body consisting of cell-substance, cell-wall, and cell-nucleus: as, bone-cells, cartilage-cells, muscle-cells, nerve-cells, fat-cells, cells of connective tissue, of mucous and serous membrane, etc., of the blood, lymph, etc. This is the usual character of cells in animals, and is the ordinary technical anatomical sense of the word.

If a single *cell*, under appropriate conditions, becomes a man in the space of a few years, there can surely be no difficulty in understanding how, under appropriate conditions, a *cell* may in the course of untold millions of years give origin to the human race.

H. Spencer, Prin. of Biol., § 113.

However complicated one of the higher animals or plants may be, it begins its separate existence under the form of a nucleated cell. *Huxley, Anat. Invert., p. 19.*

8. In *elect.*, a single jar or element of a voltaic battery. A *simple cell* ordinarily consists of plates of two different metals joined by a wire and immersed in a liquid (called the exciting liquid) which acts chemically upon one plate; this, the positive or generating plate, at the expense of which the electrical current is maintained, is usually zinc; the negative plate is often copper, but may be platinum, carbon, silver, etc. The exciting liquid is commonly dilute sulphuric acid, but solutions of sal ammoniac, common salt, etc., are also used. The current flows through the liquid from the positive plate (zinc) to the copper, and through the wire from the positive pole to the negative pole. (See figure.)

Simple Voltaic Cell.
C, copper plate; Z, zinc plate.

The current from a simple voltaic cell soon loses its strength, because hydrogen bubbles, liberated in the chemical action on the negative plate, form a film over it. This polarization of the negative plate (see *polarization*) may be partially avoided by mechanical means in a *single-fluid cell*, by using platinum, or silver covered with finely divided platinum, as in the *Smee cell*, or platinumized carbon, as in the *Walker cell*. It is more effectually prevented in a *two-fluid cell* by the addition of a second liquid (the depolarizing liquid), with which the hydrogen combines chemically. In the *Grenet cell*, or *bottle-cell*, bichromate of potash is mixed with the sulphuric acid (being hence called a *bichromate cell*) in a vessel of bottle form, and the zinc and carbon are immersed in them; the zinc, however, is raised out of the liquid when the cell is not in use. Practically, the depolarizing liquid is usually separated from the exciting liquid, as in the *compound cell*. One of the best of these is the *Daniell cell*, which consists of a zinc plate immersed in dilute sulphuric acid contained in a porous vessel, outside of which is a perforated copper plate surrounded by a solution of copper sulphate. The action is as follows: The reaction between the zinc and sulphuric acid produces zinc sulphate and hydrogen; the latter, however, instead of collecting on the copper plate, unites with the copper sulphate, forming sulphuric acid and metallic copper. The former goes to keep up the supply of acid in the inner vessel, and the latter is deposited on the copper plate. The consumption of copper sulphate is made good by a supply of crystals in a receptacle at the top. A modified form of the Daniell cell is the *gravity cell*, in which the porous vessel is done away with, and the two liquids are separated by their specific gravities; the copper sulphate surrounds the copper plate at the bottom, and the zinc sulphate the zinc plate at the top. This is the form of cell most used for telegraphic purposes in the United States. Other forms of the compound cell are the *Grove*, in which platinum and nitric

its strength, and hence is especially valuable for intermittent use; it has also the advantage that there is no waste of the zinc by local action when not in use. The *silver-chloride cell*, as devised by De la Rue, consists of zinc acted upon by sal ammoniac and a rod of silver surrounded by a cylinder of silver chloride. The *Latimer-Clark standard cell* consists of zinc and pure mercury separated by a paste made from sulphates of zinc and mercury; when suitably arranged it maintains a very constant electromotive force, and hence has been used as a standard.

Its complete form, including the ovum as a simple cell also, is the basis of the present state of the biological sciences. —**Chalice-cells.** Same as *goblet-cells*. —**Collared cell,** a cell one end of which has a raised rim or border, like a collar, as that of a collar-bearing monad, or choanoflagellate infusorian. —**Condemned cell.** See *condemned*. —**Daughter-cell.** See *mother-cell*, below.

solved the celebrated problem of parallel motion. It is composed of two long links of equal length, pivoted together at one end and at the other pivoted to the opposite angles of a rhombus composed of four equal and shorter links. For use, the junction, A, of the two long links is fixed in position, and an extra link, BC, is attached to the angle of the rhombus nearest to A. The other end, B, of the extra link is fixed in position, usually at a distance from A equal to BC. In this case, when BC turns about B as a center, the vertex, E, of the rhombus most distant from A will describe a right line. The production of this effect by link-work alone had been much sought after since the invention of the steam-engine. —**Principal cells,** the central cells of the cardiac glands of the stomach. cellulose² (sel'ū-lōs), *n.* and *a.* [*< cellula* + *-ose*.] I. *n.* In *bot.*, the essential constituent of the primary wall-membrane of all cells, a secretion from the contained protoplasm, isomeric with starch in its composition, and allied to starch, sugar, and inulin. It rarely or never exists in a simple condition unaltered with coloring or mineral matters, etc.; and with age it becomes largely transformed into lignin, suberin, or mucilage. Cotton and the bleached fiber of flax and hemp are nearly pure cellulose, and in some filter-paper it is almost chemically pure. Cellulose is remarkable for its insolubility, being dissolved without change only by an ammoniacal solution of oxalic acid, from which it may be again precipitated. Under the action of concentrated or boiling acids, or of caustic alkalis, many different products are obtained, according to the method of treatment. It is changed to glucose by long boiling with dilute sulphuric or hydrochloric acid; a substance resembling parchment is obtained by treating unsized paper with cold sulphuric acid; strong nitric acid, or a mixture of nitric and sulphuric acids, converts forms of cellulose into gun-cotton, etc. In its unchanged condition it is not colored by iodine except usually with a faint yellowish tint, which becomes a bright blue on the addition of strong sulphuric acid. Cellulose is also said to exist in the tunics of *Acidia* and in other invertebrates.—**Starch-cellulose**, the delicate skeleton of cellulose which remains when starch-granules are dissolved in saliva or pepsin.

Celtiad* (pron. kel'ti-ad), is preferred by some recent writers.] A member of one of the peoples speaking languages akin to those of Wales, Ireland, the Highlands of Scotland, and Brittany, and constituting a branch or principal division of the Indo-European family. celt² (selt), *n.* [*< W. Celt*, a flintstone.] In *archæol.*, an implement or weapon widely used among primitive and uncivilized races, and having the general form of a chisel or an ax-blade.

In the eighteenth century the name was given to the stone and bronze implements of this general shape, without careful consideration of their probable uses. The stone celts are all of a form more or less closely resembling the head of a hatchet, differing only in being sometimes flatter and with a longer cutting edge, sometimes of a section nearly circular, pointed at one end, and coming abruptly to an edge at the other. The bronze celts, the forms of which are very varied, may be divided into three principal classes: First, chisel-shaped blades without sockets, but with raised rims on each side forming a pair of grooves, apparently intended to retain a wooden handle fitted on in the direction of the length of the blade; these may be considered as spades intended for agricultural labor. Second, chisel-shaped blades, having a deep socket at the end opposite the cutting edge, and usually fitted with a loop or pierced ear on one side. Third, blades, also with a socket, but shorter and broader; these which have often been called ax-heads, are thought rather to be ferrules for the butt-end of spear-shafts and the like, the edge enabling them to be driven into the ground. See *amgarn*, *paalstab*, *pot-celt*, and *socket-celt*.
